# Part I

## Introduction to Modules

In this document, we will study the theory of modules over a commutative ring<sup>1</sup>.

### 1 Basic Definitions

#### 1.1 Definition of an $R$ -Module

**Definition 1.1.** Let  $R$  be a commutative ring<sup>2</sup>. An  $R$ -**module**  $M$  consists of an abelian group on which  $R$  acts by additive maps: there is a scalar multiplication function  $R \times M \rightarrow M$  denoted by  $(a, m) \mapsto am$  such that for all  $u, v \in M, a, b \in R$  we have

1.  $1u = u$  and  $a(bu) = (ab)u$ .
2.  $a(u + v) = au + av$  and  $(a + b)u = au + bu$ .

Throughout these notes, we often write “let  $M$  be an  $R$ -module” or “let  $I$  be an ideal in  $R$ ” without specifying what  $R$  is. In either case, it is understood that  $R$  is a commutative ring. We will also say “let  $M$  be a module over  $R$ ” instead of “let  $M$  be an  $R$ -module”. Sometimes the base ring  $R$  isn’t important to know and we will refer to  $M$  simply as a module rather than an  $R$ -module.

##### 1.1.1 Consistency in Notation

When learning Mathematics, it’s a good practice to write things down in an organized way. Doing so will help organize ideas and concepts in your mind, making it easier to work with them. For instance, we will typically use the capital letters  $R, S$  or  $A, B$  to denote rings. Similarly, we will typically use the capital letters  $M, N$  to denote modules. If  $M$  is an  $R$ -module, then we will typically use lower case letters  $a, b, c$  to denote elements of  $R$  and use lower case letters  $u, v, w$  to denote elements of  $M$ . Many authors use the lower case letters  $r, s$  to denote elements of  $R$  and use the lower case letter  $m, n$  to denote elements of  $M$ . This is completely fine! Sometimes we will even use the lower case letters  $r, s$  to denote elements of  $R$ . In fact, if we are dealing with a ring  $R$  together with a ring  $A$ , then we will try to use the lower case letters  $r, s$  to denote elements of  $R$  and the lower case letters  $a, b$  to denote elements of  $A$ . However we will try to avoid using the lower case letters  $m, n$  to denote elements of  $M$ . This is because we try to use lower case letters like  $i, j, k, l, m, n$  as indices. For instance, we may write an element in  $M$  as

$$\sum_{i=1}^m a_i u_i = a_1 u_1 + \cdots + a_m u_m. \quad (1)$$

where the  $a_i$  are elements of  $R$  and the  $u_i$  are elements of  $M$ . The lower case  $m$  here is simply the number of terms in (1).

Throughout this document, the reader will find many more examples of consistency in notation as in the case described above. Keep in mind however that this rule is not set in stone; we may violate it. The point however is that if you try to be as consistent as possible with your notation, it will make learning Mathematics much easier (and more fun!).

##### 1.1.2 Examples of $R$ -Modules

Let  $R$  be a ring and let  $X$  be a nonempty set. At the moment, the ring  $R$  and the set  $X$  have nothing to do with each other, however we’d like to turn  $X$  into an  $R$ -module somehow. How can we do this? Well, the first step would be to give  $X$  the **structure of an abelian group**! In particular, we need define an addition map  $+: X \times X \rightarrow X$  such that the pair  $(X, +)$  forms an abelian group. In this case, we say addition  $+$  **gives  $X$  the structure of an abelian group**. Once  $X$  is given the structure of an abelian group, the next thing we’d need to do is to define a scalar multiplication map  $\cdot: R \times X \rightarrow X$  such that the triple  $(X, +, \cdot)$  forms an  $R$ -module. In this case, we say addition  $+$  and multiplication  $\cdot$  **gives  $X$  the structure of an  $R$ -module**. We often use this language when describing modules.

<sup>1</sup>There is a theory of modules over a non-commutative ring, but we leave that topic to another document.

<sup>2</sup>For us, all rings have an identity element by definition. Note that some authors define rings to be associative  $\mathbb{Z}$ -algebras which do not necessarily have an identity element.

**Example 1.1.** Let  $R$  be a ring and let  $n \geq 1$ . Then the set  $R^n = \{(a_1, \dots, a_n) \mid a_i \in R\}$  can be given the structure of an  $R$ -module as follows: addition and scalar multiplication are defined by

$$(a_1, \dots, a_n) + (b_1, \dots, b_n) := (a_1 + b_1, \dots, a_n + b_n) \quad \text{and} \quad a(a_1, \dots, a_n) := (aa_1, \dots, aa_n)$$

$a \in R$  and  $(a_1, \dots, a_n), (b_1, \dots, b_n) \in R^n$ . Check that addition and scalar multiplication defined in this way really does give  $R^n$  an  $R$ -module structure.

**Example 1.2.** One of the reasons why we study  $R$ -modules is because they help us obtain information about the ring  $R$  itself. For instance, if  $R$  is a principal ideal domain, then it turns out that every finitely generated  $R$ -module is isomorphic to a direct sum of a free module plus a torsion module. The proof of this fact uses the in an essential way the fact that  $R$  is a principal ideal domain.

## 1.2 Definition of an $R$ -Linear Map

**Definition 1.2.** Let  $M$  and  $N$  be  $R$ -modules. A map  $\varphi: M \rightarrow N$  is called an  **$R$ -linear map** if for all  $a, b$  in  $R$  and  $u, v$  in  $M$ , we have

$$\varphi(au + bv) = a\varphi(u) + b\varphi(v).$$

An  $R$ -linear map  $\varphi: M \rightarrow N$  is also called an  **$R$ -module homomorphism**. A bijective  $R$ -module homomorphism is called an  **$R$ -module isomorphism**. If  $\varphi: M \rightarrow N$  is an  $R$ -module isomorphism, then we say  $M$  is **isomorphic to**  $N$ , and we denote this by  $M \cong N$ . The collection of all  $R$ -modules and  $R$ -linear maps forms a category<sup>3</sup> which we will denote by  $\mathbf{Mod}_R$ .

*Remark.* Note that  $\varphi(0) = \varphi(0 + 0) = \varphi(0) + \varphi(0)$  implies  $\varphi(0) = 0$ .

When the base ring  $R$  is understood from context, we will sometimes drop “ $R$ ” in “ $R$ -linear map” and simply write “linear map”. We also write “let  $\varphi: M \rightarrow N$  be an  $R$ -linear map” without specifying what  $R$ ,  $M$ , and  $N$  is. In this case, it is understood that  $R$  is a commutative ring and that  $M$  and  $N$  are  $R$ -modules.

## 1.3 Submodules, Kernels, and Quotient Modules

**Definition 1.3.** Let  $\varphi: M \rightarrow N$  be an  $R$ -linear map.

1. The **kernel** of  $\varphi$ , denoted  $\ker \varphi$ , is defined to be the set

$$\ker \varphi := \{u \in M \mid \varphi(u) = 0\}.$$

In a moment, we will show that  $\ker \varphi$  can be given the structure of an  $R$ -module.

2. The **image** of  $\varphi$ , denoted  $\text{im } \varphi$ , is defined to be the set

$$\text{im } \varphi := \{\varphi(u) \in N \mid u \in M\}.$$

In a moment, we will show that  $\text{im } \varphi$  can be given the structure of an  $R$ -module.

3. If  $M \subseteq N$  and  $\varphi$  is the inclusion map, then we say  $M$  is an  $R$ -submodule of  $N$ . In this case, we also define the **quotient of  $N$  with respect to  $M$** , denoted  $N/M$ , to be the set

$$N/M = \{v + M \mid v \in N\}.$$

That is,  $N/M$  is the set of equivalence classes of elements of  $N$ , where  $v_1, v_2 \in N$  are equivalent if  $v_1 - v_2 \in M$ . An equivalent class in  $N/M$  is denoted by  $v + M$  or more simply by  $\bar{v}$ . In this case, we call  $v$  a **representative** of the equivalence class  $\bar{v}$ . From basic group theory, we know that  $N/M$  has the structure of an abelian group, where addition is defined by  $\bar{v}_1 + \bar{v}_2 = \overline{v_1 + v_2}$  for all  $\bar{v}_1, \bar{v}_2 \in N/M$ . In fact,  $N/M$  has the structure of an  $R$ -module, where scalar multiplication is defined by  $a\bar{v} = \overline{av}$  for all  $a \in R$  and  $\bar{v} \in N/M$ . One checks that this is well-defined and together with addition defined above does indeed give  $N/M$  the structure of an  $R$ -module.

4. The **cokernel** of  $\varphi$ , denote  $\text{coker } \varphi$ , is defined to be the  $R$ -module

$$\text{coker } \varphi = N/\text{im } \varphi. \tag{2}$$

In a moment, we will show that  $\text{im } \varphi$  can be given the structure of an  $R$ -submodule of  $N$ , so that definition (??) makes sense.

<sup>3</sup>See the Appendix for an introduction to Category Theory.

*Remark.* Let  $N$  be an  $R$ -module and let  $M$  be a subset of  $N$ . Then  $M$  is an  $R$ -submodule of  $N$  if and only if  $M$  is nonempty and  $au + bv \in M$  for all  $a, b \in R$  and  $u, v \in M$ . Equivalently,  $M$  is an  $R$ -submodule of  $N$  if and only if  $M$  is nonempty and  $au + v \in M$  for all  $a \in R$  and  $u, v \in M$ . This is sometimes called the **submodule criterion test**. If  $M$  satisfies the submodule criterion test, then it is easy to check that we can give it the structure of an  $R$ -module by using the  $R$ -module operations from  $N$ .

**Proposition 1.1.** *Let  $\varphi: M \rightarrow N$  be an  $R$ -linear map. Then  $\ker \varphi$  is a submodule of  $M$  and  $\operatorname{im} \varphi$  is a submodule of  $N$ .*

*Proof.* Let us first show that  $\ker \varphi$  is a submodule of  $M$ . Observe that  $\ker \varphi$  is nonempty since  $0 \in \ker \varphi$ . Let  $a \in R$  and let  $u, v \in \ker \varphi$ . Then we have

$$\begin{aligned}\varphi(au + v) &= a\varphi(u) + \varphi(v) \\ &= a \cdot 0 + 0 \\ &= 0 + 0 \\ &= 0.\end{aligned}$$

It follows that  $au + v \in \ker \varphi$ . Thus  $\ker \varphi$  is a submodule of  $M$ .

Now we will show that  $\operatorname{im} \varphi$  is a submodule of  $N$ . Observe that  $\operatorname{im} \varphi$  is nonempty since  $\varphi(0) \in \operatorname{im} \varphi$ . Let  $a \in R$  and let  $\varphi(u), \varphi(v) \in \operatorname{im} \varphi$ . Then we have

$$\begin{aligned}a\varphi(u) + \varphi(v) &= \varphi(au) + \varphi(v) \\ &= \varphi(au + v).\end{aligned}$$

It follows that  $a\varphi(u) + \varphi(v) \in \operatorname{im} \varphi$ . Thus  $\operatorname{im} \varphi$  is a submodule of  $N$ . □

**Definition 1.4.**

1. Let  $M$  be an  $R$ -module and let  $N \subset M$  be a submodule. We define the **quotient module**  $M/N$  by

$$M/N = \{u + N \mid u \in M\}.$$

That is,  $M/N$  is the set of equivalence classes of elements of  $M$ , where  $u, v \in M$  are equivalent if  $u - v \in N$ . An equivalent class is denoted by  $m + N$  or  $\bar{m}$ . Each element in the class  $\bar{m}$  is called a **representative** of the class.

2. Let  $\varphi: M \rightarrow N$  be an  $A$ -module homomorphism. Then the **cokernel** of  $\varphi$  is  $\operatorname{Coker} \varphi = N/\operatorname{Im} \varphi$ .

## 1.4 Translating Modules Between Rings

Throughout this subsection, let  $f: R \rightarrow S$  be a ring homomorphism.

### 1.4.1 Restriction of scalars functor

If  $N$  is an  $S$ -module, then we can restrict it to an  $R$ -module  $N_R$  where  $N_R$  has the same underlying abelian group structure as  $N$  but with scalar multiplication given by

$$a \cdot v = f(a)v$$

for all  $a \in R$  and  $v \in N$ . This is called **restriction of scalars** since in the case where  $R \subseteq S$  we are just restricting the  $S$ -action to an  $R$ -action. If  $\psi: N \rightarrow N'$  is an  $S$ -module linear map, then we define an  $R$ -module linear map  $\psi_R: N_R \rightarrow N'_R$  by

$$\psi_R(v) = \psi(v)$$

for all  $v \in N_R$ . Let us check that  $\psi_R$  is indeed an  $R$ -linear map. We just need to check that  $\psi_R$  respects scalar multiplication since additivity is clear. Let  $a \in R$  and let  $v \in N_R$ . Then

$$\begin{aligned}\psi_R(a \cdot v) &= \psi_R(f(a)v) \\ &= \psi(f(a)v) \\ &= f(a)\psi(v) \\ &= a \cdot \psi(v) \\ &= a \cdot \psi_R(v).\end{aligned}$$

It follows that  $\psi_R$  is an  $R$ -module linear map. It is easy to check that we obtain a functor

$$-_R: \mathbf{Mod}_S \rightarrow \mathbf{Mod}_R.$$

### 1.4.2 Extension of scalars functor

If  $M$  is an  $R$ -module, then we can extend it to an  $S$ -module  $S \otimes_R M$  where scalar multiplication is defined by

$$a \cdot (b \otimes u) = ab \otimes u$$

for all  $a, b \in S$  and  $u \in M$ . This is called **extension of scalars** since in the case where  $R \subseteq S$  we are just extending the  $R$ -action to an  $S$ -action. If  $\varphi: M \rightarrow M'$  is an  $R$ -module linear map, then we define an  $S$ -module linear map  $1 \otimes \varphi: S \otimes_R M \rightarrow S \otimes_R M'$  on elementary tensors  $a \otimes u \in S \otimes_R M$  by

$$(1 \otimes \varphi)(a \otimes u) = a \otimes \varphi(u),$$

and then extend this linearly everywhere else. We just need to check that  $1 \otimes \varphi$  respects scalar multiplication since additivity is clear. Let  $a \in S$  and let  $b \otimes u$  be an elementary tensor in  $S \otimes_R M$ . Then

$$\begin{aligned} (1 \otimes \varphi)(a \cdot (b \otimes u)) &= (1 \otimes \varphi)(ab \otimes u) \\ &= ab \otimes \varphi(u) \\ &= a \cdot (b \otimes \varphi(u)) \\ &= a \cdot ((1 \otimes \varphi)(b \otimes u)). \end{aligned}$$

It follows that  $1 \otimes \varphi$  is an  $R$ -module linear map. It is easy to check that we obtain a functor

$$S \otimes_R -: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_S.$$

### 1.4.3 Restricting scalars and extending scalars form an adjoint pair

**Proposition 1.2.** *The functors  $-_R: \mathbf{Mod}_S \rightarrow \mathbf{Mod}_R$  and  $- \otimes_R S: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_S$  are adjoint functors. In a formula*

$$\mathrm{Hom}_R(M, N_R) \cong \mathrm{Hom}_S(M \otimes_R S, N).$$

**Example 1.3.** Let  $I$  be an ideal in  $R$ . Let us calculate  $\mathrm{Hom}_R(R/I, R/I)$ . We have

$$\begin{aligned} \mathrm{Hom}_R(R/I, R/I) &\cong \mathrm{Hom}_{R/I}((R/I) \otimes_R (R/I), R/I) \\ &\cong \mathrm{Hom}_{R/I}(R/I, R/I) \\ &\cong R/I. \end{aligned}$$

### 1.4.4 Base Change

There is another type of  $R$ -module that can be viewed as an  $S$ -module. For simplicity, assume that  $R \subset S$  is an extension of rings. Suppose  $M$  is an  $R$ -module and  $N$  is an  $S$ -module. Through restriction of scalars, we can view  $N$  as an  $R$ -module. Thus we can consider  $\mathrm{Hom}_R(N, M)$ . In fact,  $\mathrm{Hom}_R(N, M)$  can be viewed as an  $S$ -module via the action

$$b \cdot \varphi(v) = \varphi(bv)$$

for all  $b \in S$ ,  $\varphi \in \mathrm{Hom}_R(N, M)$ , and  $v \in N$ .

**Theorem 1.1.** *Let  $R \subset S$  be a ring extension and let  $\varphi \in \mathrm{Hom}_S(N, N')$  and let  $\psi \in \mathrm{Hom}_R(M, M')$  where  $M, M'$  are  $R$ -modules and  $N, N'$  are  $S$ -modules. Then  $\varphi^*: \mathrm{Hom}_R(N', M) \rightarrow \mathrm{Hom}_R(N, M)$  and  $\psi_*: \mathrm{Hom}_R(N, M) \rightarrow \mathrm{Hom}_R(N, M')$  are  $S$ -module homomorphisms.*

### 1.4.5 Translated Modules

In this section, we want to discuss how to translate an  $A$ -module  $M$  by an element  $x \in M$ . Let  $M^x := \{y + x \mid y \in M\}$ . We define addition and scaling operations as follows. Suppose  $a$  is an element in  $A$  and,  $y + x$  and  $y' + x$  are two elements in  $M^x$ . Then

$$\begin{aligned} (y + x) \dot{+} (y' + x) &= y + y' + x \\ a \cdot (y + x) &= a \cdot y + x. \end{aligned}$$

Addition  $\dot{+}$  makes  $M^x$  into an abelian group with identity being  $x$ , and one can check that all of the conditions for  $M^x$  to be an  $A$ -module are satisfied.

We can generalize the above construction as follows: Let  $\varphi: M \rightarrow M^\varphi$  be an isomorphism from  $M$  to some set  $M^\varphi$ . We define addition and scaling operations as follows: Suppose  $a \in A$  and  $x, y \in M^\varphi$ . Then we define

$$x \dot{+} y = \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right)$$

$$a \cdot x = \varphi \left( a\varphi^{-1}(x) \right)$$

Addition  $\dot{+}$  makes  $M^\varphi$  into an abelian group with identity being  $\varphi(0)$ . For instance, we have associativity:

$$\begin{aligned} (x \dot{+} y) \dot{+} z &= \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \dot{+} z \\ &= \varphi \left( \varphi^{-1} \left( \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \right) \dot{+} \varphi^{-1}(z) \right) \\ &= \varphi \left( \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \dot{+} \varphi^{-1}(z) \right) \\ &= \varphi \left( \varphi^{-1}(x) + \left( \varphi^{-1}(y) \dot{+} \varphi^{-1}(z) \right) \right) \\ &= \varphi \left( \varphi^{-1}(x) + \varphi \left( \varphi^{-1} \left( \varphi^{-1}(y) \dot{+} \varphi^{-1}(z) \right) \right) \right) \\ &= x \dot{+} \varphi \left( \varphi^{-1}(y) + \varphi^{-1}(z) \right) \\ &= x \dot{+} (y \dot{+} z). \end{aligned}$$

and we have commutativity:

$$\begin{aligned} x \dot{+} y &= \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \\ &= \varphi \left( \varphi^{-1}(y) + \varphi^{-1}(x) \right) \\ &= y \dot{+} x. \end{aligned}$$

One can check that all of the conditions for  $M^\varphi$  to be an  $A$ -module are satisfied. For instance, suppose  $a, b \in A$ , and  $x, y \in M^\varphi$ , we have

$$\begin{aligned} a \cdot (x \dot{+} y) &= a \cdot \left( \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \right) \\ &= \varphi \left( a \left( \varphi^{-1} \left( \varphi \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \right) \right) \right) \\ &= \varphi \left( a \left( \varphi^{-1}(x) + \varphi^{-1}(y) \right) \right) \\ &= \varphi \left( a\varphi^{-1}(x) + a\varphi^{-1}(y) \right) \\ &= \varphi \left( \varphi^{-1}(a \cdot x) + \varphi^{-1}(a \cdot y) \right) \\ &= a \cdot x \dot{+} a \cdot y. \end{aligned}$$

and

$$\begin{aligned} (a + b) \cdot x &= \varphi \left( (a + b)\varphi^{-1}(x) \right) \\ &= \varphi \left( a\varphi^{-1}(x) + b\varphi^{-1}(x) \right) \\ &= \varphi \left( \varphi^{-1}(a \cdot x) + \varphi^{-1}(b \cdot x) \right) \\ &= a \cdot x \dot{+} b \cdot x \end{aligned}$$

and

$$\begin{aligned} (ab) \cdot x &= \varphi \left( ab\varphi^{-1}(x) \right) \\ &= \varphi \left( a\varphi^{-1} \left( \varphi(b\varphi^{-1}(x)) \right) \right) \\ &= a \cdot (\varphi(b\varphi^{-1}(x))) \\ &= a \cdot (b \cdot x) \end{aligned}$$

The way we defined addition and  $A$ -scaling on  $M^\varphi$  makes  $\varphi$  an  $A$ -linear map. Indeed, we have

$$\begin{aligned} \varphi(ax + by) &= \varphi(\varphi^{-1}(\varphi(ax)) + \varphi^{-1}(\varphi(by))) \\ &= \varphi(ax) \dot{+} \varphi(by) \\ &= \varphi(a\varphi^{-1}(\varphi(x))) \dot{+} \varphi(b\varphi^{-1}(\varphi(y))) \\ &= a \cdot \varphi(x) \dot{+} b \cdot \varphi(y) \end{aligned}$$

for all  $a, b \in A$  and  $x, y \in M$ .

Now suppose  $M^\varphi = M$  and let  $\varphi$  be additive, that is,  $\varphi(x + y) = \varphi(x) + \varphi(y)$  for all  $x, y \in M$ . Then  $\dot{+}$  is the same  $+$  since  $\varphi^{-1}$  is additive and

$$\begin{aligned} x \dot{+} y &= \varphi(\varphi^{-1}(x) + \varphi^{-1}(y)) \\ &= \varphi(\varphi^{-1}(x + y)) \\ &= x + y \end{aligned}$$

for all  $x, y \in M$ . On the other hand, we can still have a different scaling map, as long as  $\varphi$  is not  $A$ -linear.

## 2 Free Modules

### 2.0.1 Generating Sets

**Definition 2.1.** Let  $M$  be an  $R$ -module and let  $\{u_\lambda\}_{\lambda \in \Lambda}$  be a collection of elements in  $M$ . We say  $\{u_\lambda\}$  **generates**  $M$  if for all  $u \in M$  there exists  $u_{\lambda_1}, \dots, u_{\lambda_n} \in \{u_\lambda\}$  and  $a_{\lambda_1}, \dots, a_{\lambda_n} \in R$  such that

$$u = a_{\lambda_1}u_{\lambda_1} + a_{\lambda_2}u_{\lambda_2} + \dots + a_{\lambda_n}u_{\lambda_n}.$$

If  $\{u_\lambda\}$  generates  $M$ , then we say  $\{u_\lambda\}$  is a **generating set** for  $M$ . We say  $M$  is **finitely-generated** if there exists a finite generating set for  $M$ .

### 2.0.2 Free Modules

**Definition 2.2.** Let  $M$  be an  $R$ -module and let  $u_1, \dots, u_n \in M$ . We say the set  $\{u_1, \dots, u_n\}$  is a **basis for**  $M$  if the following conditions hold:

1. it generates  $M$  as an  $R$ -module: for each  $u \in M$  there exists  $a_1, \dots, a_n \in R$  such that

$$u = a_1u_1 + \dots + a_nu_n,$$

2. it is linearly independent: if  $a_1, \dots, a_n \in R$  such that

$$a_1u_1 + \dots + a_nu_n = 0,$$

then  $a_i = 0$  for all  $1 \leq i \leq n$ .

More generally, let  $\{u_\lambda\}$  be a collection of elements in  $M$  indexed over some (possibly infinite) set  $\Lambda$ . We say the set  $\{u_\lambda\}$  is a **basis for**  $M$  if

1. it generates  $M$  as an  $R$ -module: for each  $u \in M$  there exists  $u_{\lambda_1}, \dots, u_{\lambda_n} \in \{u_\lambda\}$  and  $a_{\lambda_1}, \dots, a_{\lambda_n} \in R$  such that

$$u = a_{\lambda_1}u_{\lambda_1} + \dots + a_{\lambda_n}u_{\lambda_n}.$$

2. every finite subset of  $\{u_\lambda\}$  is linearly independent: if  $a_{\lambda_1}, \dots, a_{\lambda_n} \in R$  such that

$$a_{\lambda_1}u_{\lambda_1} + \dots + a_{\lambda_n}u_{\lambda_n} = 0,$$

then  $a_{\lambda_i} = 0$  for all  $1 \leq i \leq n$ .

We say  $M$  is a **free  $R$ -module** if it has a basis.

**Example 2.1.**  $R^n$  is the **standard free  $R$ -module of rank  $n$** . It has as basis the **standard basis elements**  $e_i$  where  $e_i$  is the vector with 1 in the  $i$ th entry and 0 everywhere else.

**Example 2.2.** If  $I$  is a nonzero ideal in  $R$ , then  $R/I$  is not a free  $R$ -module. Indeed, if  $r$  is a nonzero element in  $I$ , then for all  $s \in R$ , we have  $r\bar{s} = \overline{rs} = 0$  in  $R/I$ . In other words, “**torsion**” makes linear independence fail for elements of  $R/I$  when taking coefficients from  $R$ .

### 2.0.3 Universal Mapping Property of Free $R$ -Modules

Free modules are characterized by the following universal mapping property: Let  $F$  be a free  $R$ -module with basis  $\{e_\lambda\}$  indexed over a set  $\Lambda$ . Then for all  $R$ -modules  $M$  and for all  $\{u_\lambda\} \subseteq M$  there exists a unique  $R$ -module homomorphism  $\varphi: F \rightarrow M$  such that  $\varphi(e_\lambda) = u_\lambda$  for all  $\lambda \in \Lambda$ . In terms of diagrams, this is pictured as follows:

$$\begin{array}{ccc} \{e_\lambda\} & \xhookrightarrow{\quad} & F \\ & \searrow e_\lambda \mapsto u_\lambda & \downarrow \exists! \varphi \\ & & M \end{array}$$

Using the universal mapping property of free  $R$ -modules, let us prove the following theorem:

**Theorem 2.1.** *If  $F$  and  $G$  are finite rank free  $R$ -modules with basis  $e_1, \dots, e_n$  and  $f_1, \dots, f_n$  respectively, then  $F \cong G$ .*

*Proof.* By the universal mapping property of free  $R$ -modules there exists a unique  $R$ -module homomorphism  $\varphi: F \rightarrow G$  such that  $\varphi(e_i) = f_i$  for all  $i = 1, \dots, n$ . Similarly, there exists a unique  $R$ -module homomorphism  $\psi: G \rightarrow F$  such that  $\psi(f_i) = e_i$  for all  $i = 1, \dots, n$ . In particular, we see that  $\psi \circ \varphi: F \rightarrow F$  satisfies  $(\psi \circ \varphi)(e_i) = e_i$ . But we also have  $1(e_i) = e_i$  for all  $i = 1, \dots, n$ , where  $1: F \rightarrow F$  is the identity map. Therefore by uniqueness of the map in the universal mapping property of free  $R$ -modules, we must have  $\psi \circ \varphi = 1$ . A similar argument shows that  $\varphi \circ \psi = 1$ .  $\square$

**Corollary.** *Let  $F$  be a free  $R$ -module with basis  $e_1, \dots, e_n \in F$ . Then  $F \cong R^n$ .*

*Remark.* Note that you can prove Theorem (2.1) without the universal mapping property of free  $R$ -modules, but the point is that you'd have to show well-definedness, linearity, etc... of the maps constructed. The point is that all of this is built into the universal mapping property of free  $R$ -modules.

### 2.0.4 Representing $R$ -module Homomorphisms By Matrices

Let  $F$  be a  $R$ -module with basis  $\beta = \{\beta_1, \dots, \beta_m\}$  and let  $G$  be a free  $R$ -module with basis  $\gamma = \{\gamma_1, \dots, \gamma_n\}$ . If  $v \in F$ , then for each  $1 \leq i \leq m$ , there exists unique  $a_i \in R$  such that

$$v = \sum_{i=1}^m a_i \beta_i.$$

Since the  $a_i$  are uniquely determined, we are justified in making the following definition:

**Definition 2.3.** The **column representation of  $v$  with respect to the basis  $\beta$** , denoted  $[v]_\beta$ , is defined by

$$[v]_\beta := \begin{pmatrix} a_1 \\ \vdots \\ a_m \end{pmatrix}.$$

**Proposition 2.1.** *Let  $[\cdot]_\beta: V \rightarrow R^m$  be given by*

$$[\cdot]_\beta(v) = [v]_\beta$$

*for all  $v \in V$ . Then  $[\cdot]_\beta$  is an isomorphism.*

*Proof.* We first show that  $[\cdot]_\beta$  is  $R$ -linear. Let  $v_1, v_2 \in V$  and  $c_1, c_2 \in R$ . Then for each  $1 \leq i \leq m$ , there exists unique  $a_{i1}, a_{i2} \in R$  such that

$$v_1 = \sum_{i=1}^m a_{i1} \beta_i \quad \text{and} \quad v_2 = \sum_{i=1}^m a_{i2} \beta_i.$$

Therefore we have

$$\begin{aligned} a_1 v_1 + a_2 v_2 &= a_1 \sum_{i=1}^m a_{i1} \beta_i + a_2 \sum_{i=1}^m a_{i2} \beta_i \\ &= \sum_{i=1}^m (a_1 a_{i1} + a_2 a_{i2}) \beta_i. \end{aligned}$$

This implies

$$\begin{aligned} [a_1v_1 + a_2v_2]_\beta &= \begin{pmatrix} a_1a_{11} + a_2a_{12} \\ \vdots \\ a_1a_{m1} + a_2a_{m2} \end{pmatrix} \\ &= a_1 \begin{pmatrix} a_{11} \\ \vdots \\ a_{m1} \end{pmatrix} + a_2 \begin{pmatrix} a_{12} \\ \vdots \\ a_{m2} \end{pmatrix} \\ &= a_1[v_1]_\beta + a_2[v_2]_\beta. \end{aligned}$$

Therefore  $[\cdot]_\beta$  is linear. To see that  $[\cdot]_\beta$  is an isomorphism, note that  $[\beta_i] = e_i$ , where  $e_i$  is the column vector in  $K^n$  whose  $i$ -th entry is 1 and whose entry everywhere else is 0. Thus,  $[\cdot]_\beta$  restricts to a bijection on basis sets

$$[\cdot]_\beta: \{\beta_1, \dots, \beta_m\} \rightarrow \{e_1, \dots, e_n\},$$

and so it must be an isomorphism.  $\square$

### 2.0.5 Matrix Representation of a Linear Map

Let  $\varphi$  be an  $R$ -linear map from  $F$  to  $G$ . Then for each  $1 \leq i \leq m$  and  $1 \leq j \leq n$ , there exists unique elements  $a_{ji} \in R$  such that

$$\varphi(\beta_i) = \sum_{j=1}^n a_{ji} \gamma_j \quad (3)$$

for all  $1 \leq i \leq m$ . Since the  $a_{ji}$  are uniquely determined, we are justified in making the following definition:

**Definition 2.4.** The **matrix representation of  $\varphi$  with respect to the bases  $\beta$  and  $\gamma$** , denoted  $[\varphi]_\beta^\gamma$ , is defined to be the  $n \times m$  matrix

$$[\varphi]_\beta^\gamma := \begin{pmatrix} a_{11} & \cdots & a_{1m} \\ \vdots & \ddots & \vdots \\ a_{n1} & \cdots & a_{nm} \end{pmatrix}.$$

**Proposition 2.2.** Let  $\varphi$  be a linear map from  $F$  to  $G$ . Then

$$[\varphi]_\beta^\gamma [v]_\beta = [\varphi(v)]_\gamma$$

for all  $v \in F$ .

*Remark.* In terms of diagrams, this proposition says that the following diagram is commutative

$$\begin{array}{ccc} R^m & \xrightarrow{[\varphi]_\beta^\gamma} & R^n \\ \uparrow [\cdot]_\beta & & \uparrow [\cdot]_\gamma \\ F & \xrightarrow{\varphi} & G \end{array}$$

## 2.1 Submodules, Kernels, and Quotient Modules

**Definition 2.5.** Let  $M$  be an  $A$ -module. A non-empty subset  $N \subset M$  is called a **submodule** of  $M$  if for all  $m, n$  in  $N$  and  $a$  in  $A$ , we have

$$am + n \in N.$$

The next definition gives us two important examples of submodules.

**Definition 2.6.** Let  $\varphi: M \rightarrow N$  be an  $A$ -module homomorphism. The **kernel** of  $\varphi$  is defined by  $\text{Ker} \varphi = \{m \in M \mid \varphi(m) = 0\}$ . The **image** of  $\varphi$  is defined by  $\text{Im} \varphi = \{\varphi(m) \mid m \in M\}$ .

*Remark.*  $\text{Ker} \varphi$  is a submodule of  $M$  and  $\text{Im} \varphi$  is a submodule of  $N$ .

**Definition 2.7.**

1. Let  $M$  be an  $A$ -module and  $N \subset M$  be a submodule. We define the **quotient module**  $M/N$  by

$$M/N = \{m + N \mid m \in M\}.$$

That is,  $M/N$  is the set of equivalence classes of elements of  $M$ , where  $m, n \in M$  are equivalent if  $m - n \in N$ . An equivalent class is denoted by  $m + N$  or  $\bar{m}$ . Each element in the class  $\bar{m}$  is called a **representative** of the class.

2. Let  $\varphi : M \rightarrow N$  be an  $A$ -module homomorphism. Then the **cokernel** of  $\varphi$  is  $\text{Coker } \varphi = N/\text{Im } \varphi$ .

**Definition 2.8.** Let  $M$  be an  $A$ -module.  $M$  is called of **finite presentation** or **finitely presented** if there exists an  $n \times m$ -matrix  $\varphi$  such that  $M$  is isomorphic to the cokernel of the map  $\varphi : A^m \rightarrow A^n$ . We call  $\varphi$  a **presentation matrix** of  $M$ . We write

$$A^m \xrightarrow{\varphi} A^n \longrightarrow M \longrightarrow 0$$

to denote a presentation of  $M$ .

Constructive module theory is concerned with modules of finite presentation, that is, with modules which can be given as the cokernel of some matrix. All operations with modules are then represented by operations with the corresponding presentation matrices. We shall see later on that every finitely generated module over a Noetherian ring is finitely presented. As polynomial rings and localizations thereof are Noetherian every finitely generated module over these rings is of finite presentation.

**Example 2.3.** Let  $A = \mathbb{Q}[x, y, z]$  and let  $M$  be the submodule of  $A^2$  generated by the column vectors  $(xy, yz)^t$  and  $(xz, z^2)^t$ . This means we have a map

$$\begin{array}{ccc} A^2 & \xrightarrow{\begin{pmatrix} xy & xz \\ yz & z^2 \end{pmatrix}} & M \\ e_1 & \longmapsto & xye_1 + yze_2 \\ e_2 & \longmapsto & xze_1 + z^2e_2 \end{array}$$

To obtain a presentation of  $N$ , we need to compute the kernel of this map. The kernel is generated by the column vector  $(-z, y)^t$ . So  $(-z, y)^t$  is the presentation matrix of  $M$ .

$$\begin{array}{ccccc} A & \xrightarrow{\begin{pmatrix} -z \\ y \end{pmatrix}} & A^2 & \xrightarrow{\begin{pmatrix} xy & xz \\ yz & z^2 \end{pmatrix}} & M \\ e_1 & \longmapsto & -ze_1 + ye_2 & & \\ & & e_1 & \longmapsto & xye_1 + yze_2 \\ & & e_2 & \longmapsto & xze_1 + z^2e_2 \end{array}$$

**Lemma 2.2.** Let  $M$  and  $N$  be two  $A$ -modules with presentations

$$A^m \xrightarrow{\varphi} A^n \xrightarrow{\pi} M \longrightarrow 0 \quad \text{and} \quad A^r \xrightarrow{\psi} A^s \xrightarrow{\kappa} N \longrightarrow 0.$$

1. Let  $\lambda : M \rightarrow N$  be an  $A$ -module homomorphism, then there exist  $A$ -module homomorphisms  $\alpha : A^m \rightarrow A^r$  and  $\beta : A^n \rightarrow A^s$  such that the following diagram commutes:

$$\begin{array}{ccccccc} A^m & \xrightarrow{\varphi} & A^n & \xrightarrow{\pi} & M & \longrightarrow & 0 \\ \downarrow \alpha & & \downarrow \beta & & \downarrow \lambda & & \\ A^r & \xrightarrow{\psi} & A^s & \xrightarrow{\kappa} & N & \longrightarrow & 0. \end{array}$$

that is,  $\beta \circ \varphi = \psi \circ \alpha$  and  $\lambda \circ \pi = \kappa \circ \beta$ .

2. Let  $\beta : A^n \rightarrow A^s$  be an  $A$ -module homomorphism such that  $\beta(\text{Im}(\varphi)) \subset \text{Im}(\psi)$ . Then there exist  $A$ -module homomorphisms  $\alpha : A^m \rightarrow A^r$  and  $\lambda : M \rightarrow N$  such that the corresponding diagram commutes.

*Proof.* (1) : Let  $\{e_1, \dots, e_n\}$  be an  $A$ -basis for  $A^n$  and choose  $x_i \in A^s$  such that  $\kappa(x_i) = (\lambda \circ \pi)(e_i)$ . We define  $\beta(\sum_{i=1}^n a_i e_i) = \sum_{i=1}^n a_i x_i$ . Obviously  $\beta$  is an  $A$ -module homomorphism and  $\lambda \circ \pi = \kappa \circ \beta$ . Let  $\{f_1, \dots, f_m\}$  be a basis of  $A^m$ . Then  $(\kappa \circ \beta \circ \varphi)(f_i) = (\lambda \circ \pi \circ \varphi)(f_i) = 0$ , so  $\beta(\varphi(f_i)) \in \text{Ker}(\kappa)$ . Therefore, there exists  $y_i \in A^r$  such that  $\psi(y_i) = (\beta \circ \varphi)(f_i)$ . We define  $\alpha(\sum_{i=1}^m b_i f_i) = \sum_{i=1}^m b_i y_i$ . Again  $\alpha$  is an  $A$ -module homomorphism and  $\psi \circ \alpha = \beta \circ \varphi$ .

(2) : Define  $\lambda(m) = (\kappa \circ \beta)(\tilde{m})$ , for some  $\tilde{m} \in A^n$  with  $\pi(\tilde{m}) = m$ . To see that this definition does not depend on the choice of  $\tilde{m}$ , let  $\tilde{m} + \varphi(x)$  be another lift where  $x \in A^m$ . Then  $(\kappa \circ \beta)(\tilde{m} + \varphi(x)) = (\kappa \circ \beta)(\tilde{m}) + (\kappa \circ \beta \circ \varphi)(x) = (\kappa \circ \beta)(\tilde{m})$ . Obviously,  $\lambda$  is an  $A$ -module homomorphism satisfying  $\lambda \circ \pi = \kappa \circ \beta$ . We can define  $\alpha$  as in (1).  $\square$

## 2.2 Short Exact Sequences and Splitting Modules

**Definition 2.9.** A sequence of  $R$ -modules and  $R$ -linear maps

$$L \xrightarrow{\varphi} M \xrightarrow{\psi} N$$

is called **exact at**  $M$  if  $\text{im } \varphi = \ker \psi$ . A **short exact sequence** is a sequence of  $R$ -modules and  $R$ -linear maps

$$0 \longrightarrow L \xrightarrow{\varphi} M \xrightarrow{\psi} N \longrightarrow 0$$

which is exact at  $L$ ,  $M$ , and  $N$ .

### 2.2.1 Five Lemma

**Proposition 2.3.** Suppose the following diagram of  $R$ -modules and  $R$ -homomorphisms is commutative with exact rows

$$\begin{array}{ccccccccc} M_1 & \xrightarrow{\varphi_1} & M_2 & \xrightarrow{\varphi_2} & M_3 & \xrightarrow{\varphi_3} & M_4 & \xrightarrow{\varphi_4} & M_5 \\ \downarrow \psi_1 & & \downarrow \psi_2 & & \downarrow \psi_3 & & \downarrow \psi_4 & & \downarrow \psi_5 \\ M'_1 & \xrightarrow{\varphi'_1} & M'_2 & \xrightarrow{\varphi'_2} & M'_3 & \xrightarrow{\varphi'_3} & M'_4 & \xrightarrow{\varphi'_4} & M'_5 \end{array}$$

1. If  $\psi_2, \psi_4$  are surjective and  $\psi_5$  is injective, then  $\psi_3$  is surjective.
2. If  $\psi_2, \psi_4$  are injective and  $\psi_1$  is surjective, then  $\psi_3$  is injective.

*Proof.*

1. Suppose  $\psi_2, \psi_4$  are surjective and  $\psi_5$  is injective and let  $u'_3 \in M'_3$ . Since  $\psi_4$  is surjective, we may choose a  $u_4 \in M_4$  such that  $\psi_4(u_4) = \varphi'_3(u'_3)$ . Observe that

$$\begin{aligned} \psi_5 \varphi_4(u_4) &= \varphi'_4 \psi_4(u_4) \\ &= \varphi'_4 \varphi'_3(u'_3) \\ &= 0. \end{aligned}$$

It follows that  $\varphi_4(u_4) = 0$  since  $\psi_5$  is injective. Therefore we may choose a  $u_3 \in M_3$  such that  $\varphi_3(u_3) = u_4$  (by exactness of the top row). Now observe that

$$\begin{aligned} \varphi'_3(u'_3 - \psi_3(u_3)) &= \varphi'_3(u'_3) - \varphi'_3 \psi_3(u_3) \\ &= \psi_4(u_4) - \psi_4 \varphi_3(u_3) \\ &= \psi_4(u_4) - \psi_4(u_4) \\ &= 0. \end{aligned}$$

Therefore we may choose a  $u'_2 \in M'_2$  such that  $\varphi'_2(u'_2) = u'_3 - \psi_3(u_3)$  (by exactness of the bottom row). Since  $\psi_2$  is surjective, we may choose a  $u_2 \in M_2$  such that  $\psi_2(u_2) = u'_2$ . Finally we see that

$$\begin{aligned} \psi_3(\varphi_2(u_2) + u_3) &= \psi_3 \varphi_2(u_2) + \psi_3(u_3) \\ &= \varphi'_2 \psi_2(u_2) + \psi_3(u_3) \\ &= \varphi'_2(u'_2) + \psi_3(u_3) \\ &= u'_3 - \psi_3(u_3) + \psi_3(u_3) \\ &= u'_3. \end{aligned}$$

It follows that  $\psi_3$  is surjective.

2. Suppose  $\psi_2, \psi_4$  are injective and  $\psi_1$  is surjective and let  $u_3 \in \ker \psi_3$ . Observe that

$$\begin{aligned} \psi_4 \varphi_3(u_3) &= \varphi'_4 \psi_3(u_3) \\ &= \varphi'_4(0) \\ &= 0. \end{aligned}$$

It follows that  $\varphi_3(u_3) = 0$  since  $\psi_4$  is injective. Therefore we may choose a  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$  (by exactness of the top row). Now observe that

$$\begin{aligned}\varphi'_2\psi_2(u_2) &= \psi_3\varphi_2(u_2) \\ &= \psi_3(u_3) \\ &= 0.\end{aligned}$$

Therefore we may choose a  $u'_1 \in M'_1$  such that  $\varphi'_1(u'_1) = \psi_2(u_2)$  (by exactness of the bottom row). Since  $\psi_1$  is surjective, we may choose a  $u_1 \in M_1$  such that  $\psi_1(u_1) = u'_1$ . Now observe that

$$\begin{aligned}\psi_2\varphi_1(u_1) &= \varphi'_1\psi_1(u_1) \\ &= \varphi'_1(u'_1) \\ &= \psi_2(u_2).\end{aligned}$$

It follows that  $\varphi_1(u_1) = u_2$  since  $\psi_2$  is injective. Therefore

$$\begin{aligned}u_3 &= \varphi_2(u_2) \\ &= \varphi_2\varphi_1(u_1) \\ &= 0,\end{aligned}$$

which implies  $\ker \psi_3 = 0$ . Thus  $\psi_3$  is injective. □

### 2.2.2 The $3 \times 3$ Lemma

**Proposition 2.4.** *Consider the following diagram*

$$\begin{array}{ccccccc} & & 0 & & 0 & & 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & M_1 & \xrightarrow{\varphi_1} & M_2 & \xrightarrow{\varphi_2} & M_3 \longrightarrow 0 \\ & & \downarrow \psi_1 & & \downarrow \psi_2 & & \downarrow \psi_3 \\ 0 & \longrightarrow & M'_1 & \xrightarrow{\varphi'_1} & M'_2 & \xrightarrow{\varphi'_2} & M'_3 \longrightarrow 0 \\ & & \downarrow \psi'_1 & & \downarrow \psi'_2 & & \downarrow \psi'_3 \\ 0 & \longrightarrow & M''_1 & \xrightarrow{\varphi''_1} & M''_2 & \xrightarrow{\varphi''_2} & M''_3 \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ & & 0 & & 0 & & 0 \end{array}$$

*If the columns and top two rows are exact, then the bottom row is exact.*

*Proof.* We first show  $\varphi''_1$  is injective. Let  $u''_1 \in \ker \varphi''_1$ . Since  $\psi'_1$  is surjective (by exactness of first column) we may choose a  $u'_1 \in M'_1$  such that  $\psi'_1(u'_1) = u''_1$ . Then

$$\begin{aligned}\psi'_2\varphi'_1(u'_1) &= \varphi''_1\psi'_1(u'_1) \\ &= \varphi''_1(u''_1) \\ &= 0\end{aligned}$$

implies  $\varphi'_1(u'_1) \in \ker \psi'_2$ . Therefore there exists a unique  $u_2 \in M_2$  such that  $\psi_2(u_2) = \varphi'_1(u'_1)$  (by exactness of second column). Then

$$\begin{aligned}\psi_3\varphi_2(u_2) &= \varphi'_2\psi_2(u_2) \\ &= \varphi'_2\varphi'_1(u'_1) \\ &= 0\end{aligned}$$

implies  $\varphi_2(u_2) = 0$  since  $\psi_3$  is injective (by exactness of third column). Thus  $u_2 \in \ker \varphi_2$  and so there exists a unique  $u_1 \in M_1$  such that  $\varphi_1(u_1) = u_2$  (by exactness of first row). Therefore

$$\begin{aligned}\varphi'_1\psi_1(u_1) &= \psi_2\varphi_1(u_1) \\ &= \psi_2(u_2) \\ &= \varphi'_1(u'_1)\end{aligned}$$

implies  $\psi_1(u_1) = u'_1$  since  $\varphi'_1$  is injective (by exactness of second row). Thus

$$\begin{aligned} u''_1 &= \psi'_1(u'_1) \\ &= \psi'_1\psi_1(u_1) \\ &= 0. \end{aligned}$$

Now we show  $\ker \varphi''_2 = \text{im } \varphi''_1$ . Let  $u''_2 \in \ker \varphi''_2$ . Since  $\psi'_2$  is surjective (by exactness of second column), we may choose a  $u'_2 \in M'_2$  such that  $\psi'_2(u'_2) = u''_2$ . Then

$$\begin{aligned} \psi'_3\varphi'_2(u'_2) &= \varphi''_2\psi'_2(u'_2) \\ &= \varphi''_2(u''_2) \\ &= 0 \end{aligned}$$

implies  $\varphi'_2(u'_2) \in \ker \psi'_3$ . Therefore there exists a unique  $u_3 \in M_3$  such that  $\psi_3(u_3) = \varphi'_2(u'_2)$  (by exactness of third column). Since  $\varphi_2$  is surjective, we may choose a  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$ . Then

$$\begin{aligned} \varphi'_2(\psi_2(u_2) - u'_2) &= \varphi'_2\psi_2(u_2) - \varphi'_2(u'_2) \\ &= \psi_3\varphi_2(u_2) - \varphi'_2(u'_2) \\ &= \psi_3(u_3) - \varphi'_2(u'_2) \\ &= \varphi'_2(u'_2) - \varphi'_2(u'_2) \\ &= 0 \end{aligned}$$

implies  $\psi_2(u_2) - u'_2 \in \ker \varphi'_2$ . Therefore there exists a unique  $u'_1 \in M'_1$  such that  $\varphi'_1(u'_1) = \psi_2(u_2) - u'_2$  (by exactness of second row). Therefore

$$\begin{aligned} \varphi''_1\psi'_1(u'_1) &= \psi'_2\varphi'_1(u'_1) \\ &= \psi'_2(\psi_2(u_2) - u'_2) \\ &= \psi'_2\psi_2(u_2) - \psi'_2(u'_2) \\ &= \psi'_2(u'_2) \\ &= u''_2. \end{aligned}$$

It follows that  $u''_2 \in \text{im } \varphi''_1$ . Thus  $\ker \varphi''_2 \subseteq \text{im } \varphi''_1$ . For the reverse inclusion, let  $u''_2 \in M''_2$ . Choose  $u''_1 \in M''_1$  such that  $\varphi''_1(u''_1) = u''_2$ . Since  $\psi'_1$  is surjective (by exactness of first column), we may choose a  $u'_1 \in M'_1$  such that  $\psi'_1(u'_1) = u''_1$ . Then

$$\begin{aligned} 0 &= \psi'_3\varphi'_2\varphi'_1(u'_1) \\ &= \varphi''_2\psi'_2\varphi'_1(u'_1) \\ &= \varphi''_2\varphi''_1\psi'_1(u'_1) \\ &= \varphi''_2\varphi''_1(u''_1) \\ &= \varphi''_2(u''_2) \end{aligned}$$

implies  $u''_2 \in \ker \varphi''_2$ . Thus  $\ker \varphi''_2 \supseteq \text{im } \varphi''_1$ .

The last step is to show  $\varphi''_2$  is surjective. Let  $u''_3 \in M''_3$ . Since  $\psi'_3$  is surjective (by exactness of third column), we may choose a  $u'_3 \in M'_3$  such that  $\psi'_3(u'_3) = u''_3$ . Since  $\varphi'_2$  is surjective (by exactness of second row), we may choose a  $u'_2 \in M'_2$  such that  $\varphi'_2(u'_2) = u'_3$ . Then

$$\begin{aligned} \varphi''_2\psi'_2(u'_2) &= \psi'_3\varphi'_2(u'_2) \\ &= \psi'_3(u'_3) \\ &= u''_3 \end{aligned}$$

implies  $\varphi''_2$  is surjective. □

### 2.2.3 The Snake Lemma

**Proposition 2.5.** Consider the following commutative diagram with exact rows

$$\begin{array}{ccccccc} & M_1 & \xrightarrow{\varphi_1} & M_2 & \xrightarrow{\varphi_2} & M_3 & \longrightarrow 0 \\ & \downarrow \psi_1 & & \downarrow \psi_2 & & \downarrow \psi_3 & \\ 0 & \longrightarrow & M'_1 & \xrightarrow{\varphi'_1} & M'_2 & \xrightarrow{\varphi'_2} & M'_3 \end{array} \quad (4)$$

Then there exists an exact sequence

$$\ker \psi_1 \xrightarrow{\widetilde{\varphi}_1} \ker \psi_2 \xrightarrow{\widetilde{\varphi}_2} \ker \psi_3 \xrightarrow{\partial} \operatorname{coker} \psi_1 \xrightarrow{\overline{\varphi}_1'} \operatorname{coker} \psi_2 \xrightarrow{\overline{\varphi}_2'} \operatorname{coker} \psi_3. \quad (5)$$

Moreover, if  $\varphi_1$  is injective, then  $\widetilde{\varphi}_1$  is injective; and if  $\varphi_2'$  is surjective, then  $\overline{\varphi}_2'$  is surjective.

*Proof.*

**Step 1:** We first define the maps in question. Define  $\widetilde{\varphi}_1: \ker \psi_1 \rightarrow \ker \psi_2$  by

$$\widetilde{\varphi}_1(u_1) = \varphi_1(u_1)$$

for all  $u_1 \in \ker \psi_1$ . Note that  $\widetilde{\varphi}_1$  lands in  $\ker \psi_2$  by the commutativity of the diagram. Indeed,

$$\begin{aligned} \psi_2 \widetilde{\varphi}_1(u_1) &= \psi_2 \varphi_1(u_1) \\ &= \varphi_1' \psi_1(u_1) \\ &= \varphi_1'(0) \\ &= 0 \end{aligned}$$

implies  $\widetilde{\varphi}_1(u_1) \in \ker \psi_2$  for all  $u_1 \in \ker \psi_1$ . Also note that  $\widetilde{\varphi}_1$  is an  $R$ -module homomorphism since  $\varphi_1$  is an  $R$ -module homomorphism. Similarly, we define  $\widetilde{\varphi}_2: \ker \psi_2 \rightarrow \ker \psi_3$  by

$$\widetilde{\varphi}_2(u_2) = \varphi_2(u_2)$$

for all  $u_2 \in \ker \psi_2$ .

Next we define  $\partial: \ker \psi_3 \rightarrow \operatorname{coker} \psi_1$  as follows: let  $u_3 \in \ker \psi_3$ . Choose  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$  (such an element exists because  $\varphi_2$  is surjective by exactness of the first row). By the commutativity of the diagram, we have

$$\begin{aligned} \varphi_2' \psi_2(u_2) &= \psi_3 \varphi_2(u_2) \\ &= \psi_3(u_3) \\ &= 0. \end{aligned}$$

It follows that  $\psi_2(u_2) \in \ker \varphi_2'$ . Therefore there exists a unique  $u_1' \in M_1'$  such that  $\varphi_1'(u_1') = \psi_2(u_2)$  (by exactness of the second row). We set

$$\partial(u_3) = \overline{u_1'}$$

where  $\overline{u_1'}$  is the coset in  $\operatorname{coker} \psi_1$  with  $u_1'$  as a representative. We must check that  $\partial$  defined in this is in fact a well-defined map. There was one choice that we made in our construction, namely the lift of  $u_3$  under  $\varphi_2$  to  $u_2$ . So let  $v_2$  be another element in  $M_2$  such that  $\varphi_2(v_2) = u_3$ . Denote by  $v_1'$  to be the unique element in  $M_1'$  such that  $\varphi_1'(v_1') = \psi_2(v_2)$ . We must show that  $\overline{u_1'} = \overline{v_1'}$  in  $\operatorname{coker} \psi_1$ . In other words, we must show that  $v_1' - u_1' \in \operatorname{im} \psi_1$ . Observe that

$$\begin{aligned} \varphi_2(v_2 - u_2) &= \varphi_2(v_2) - \varphi_2(u_2) \\ &= u_3 - u_3 \\ &= 0 \end{aligned}$$

implies  $v_2 - u_2 \in \ker \varphi_2$ . It follows that there exists a unique element  $u_1 \in M_1$  such that  $\varphi_1(u_1) = v_2 - u_2$  (by exactness of the first row). Then

$$\begin{aligned} \varphi_1' \psi_1(u_1) &= \psi_2 \varphi_1(u_1) \\ &= \psi_2(v_2 - u_2) \\ &= \psi_2(v_2) - \psi_2(u_2) \\ &= \varphi_1'(v_1') - \varphi_1'(u_1') \\ &= \varphi_1'(v_1' - u_1') \end{aligned}$$

implies  $\psi_1(u_1) = v_1' - u_1'$  since  $\varphi_1'$  is injective (by exactness of the second row). It follows that  $v_1' - u_1' \in \operatorname{im} \psi_1$ , and hence  $\partial$  is well-defined.

Finally, we define  $\overline{\varphi}_1': \operatorname{coker} \psi_1 \rightarrow \operatorname{coker} \psi_2$  by

$$\overline{\varphi}_1'(\overline{u_1'}) = \overline{\varphi_1'(u_1')}$$

for all  $\overline{u'_1} \in \text{coker } \psi_1$ . The map  $\overline{\varphi'_1}$  is well-defined by the commutativity of the diagram. Indeed, let  $v'_1$  be another representative of the coset  $\overline{u'_1}$  in  $\text{coker } \psi_1$ . Choose  $u_1 \in M_1$  such that  $v'_1 - u'_1 = \psi_1(u_1)$ . Then

$$\begin{aligned}\psi_2\varphi_1(u_1) &= \varphi'_1\psi_1(u_1) \\ &= \varphi'_1(v'_1 - u'_1) \\ &= \varphi'_1(v'_1) - \varphi'_1(u'_1).\end{aligned}$$

It follows that  $\varphi'_1(v'_1) - \varphi'_1(u'_1) \in \text{im } \psi_2$ , and hence  $\varphi'_1(v'_1)$  and  $\varphi'_1(u'_1)$  represent the same coset in  $\text{coker } \psi_2$ . Similarly, we define  $\overline{\varphi'_2}: \text{coker } \psi_2 \rightarrow \text{coker } \psi_3$  by

$$\overline{\varphi'_2}(\overline{u'_2}) = \overline{\varphi'_2(u'_2)}$$

for all  $\overline{u'_2} \in \text{coker } \psi_2$ .

**Step 2:** Now that we've defined the maps in question, we will now show that the sequence (4) is exact as well as prove the "moreover" part of the proposition. First we show exactness at  $\ker \psi_2$ . Observe that

$$\begin{aligned}\widetilde{\varphi_2}\widetilde{\varphi_1}(u_1) &= \varphi_2\varphi_1(u_1) \\ &= 0\end{aligned}$$

for all  $u_1 \in \ker \psi_1$ . It follows that  $\ker \widetilde{\varphi_2} \supseteq \text{im } \widetilde{\varphi_1}$ . Conversely, let  $u_2 \in \ker \widetilde{\varphi_2}$ . Thus  $u_2 \in \ker \varphi_2 \cap \ker \psi_2$ . By exactness of the top row in (3), we may choose a  $u_1 \in M_1$  such that  $\varphi_1(u_1) = u_2$ . Moreover,

$$\begin{aligned}\varphi'_1\psi_1(u_1) &= \psi_2\varphi_1(u_1) \\ &= \psi_2(u_2) \\ &= 0\end{aligned}$$

implies  $\psi_1(u_1) = 0$  since  $\varphi'_1$  is injective (by exactness of the bottom row in (3)). Therefore  $u_1 \in \ker \psi_1$ , and so  $u_2 \in \text{im } \widetilde{\varphi_1}$ . Thus  $\ker \widetilde{\varphi_2} \subseteq \text{im } \widetilde{\varphi_1}$ .

Next we show exactness at  $\ker \psi_3$ : let  $u_3 \in \ker \partial$ . Choose  $u_2 \in M_2$  and  $u'_1 \in M'_1$  such that  $\varphi_2(u_2) = u_3$  and  $\varphi'_1(u'_1) = \psi_2(u_2)$ . Then

$$\begin{aligned}0 &= \partial(u_3) \\ &= \overline{u'_1}\end{aligned}$$

implies  $u'_1 \in \text{im } \psi_1$ . Choose  $u_1 \in M_1$  such that  $\psi_1(u_1) = u'_1$ . Then

$$\begin{aligned}\psi_2(u_2 - \varphi_1(u_1)) &= \psi_2(u_2) - \psi_2\varphi_1(u_1) \\ &= \psi_2(u_2) - \varphi'_1\psi_1(u_1) \\ &= \psi_2(u_2) - \varphi'_1(u'_1) \\ &= \psi_2(u_2) - \psi_2(u_2) \\ &= 0\end{aligned}$$

implies  $u_2 - \varphi_1(u_1) \in \ker \psi_2$ . Furthermore, we have

$$\begin{aligned}\varphi_2(u_2 - \varphi_1(u_1)) &= \varphi_2(u_2) - \varphi_2\varphi_1(u_1) \\ &= \varphi_2(u_2) \\ &= u_3.\end{aligned}$$

It follows that  $u_3 \in \text{im } \widetilde{\varphi_2}$ . Thus  $\ker \partial \subseteq \text{im } \widetilde{\varphi_2}$ . Conversely, let  $u_3 \in \text{im } \widetilde{\varphi_2}$ . Choose  $u_2 \in \ker \psi_2$  such that  $\varphi_2(u_2) = u_3$ . Then  $0 \in M'_1$  is the unique element in  $M'_1$  which maps to  $\psi_2(u_2) = 0$ . Thus  $\partial(u_3) = \overline{0}$  which implies  $\ker \partial \supseteq \text{im } \widetilde{\varphi_2}$ .

Next we show exactness at  $\text{coker } \psi_1$ : let  $\overline{u'_1} \in \ker \overline{\varphi'_1}$ . Then  $\varphi'_1(u'_1) = \psi_2(u_2)$  for some  $u_2 \in M_2$ . Moreover,

$$\begin{aligned}\psi_3\varphi_2(u_2) &= \varphi'_2\psi_2(u_2) \\ &= \varphi'_2\varphi'_1(u'_1) \\ &= 0\end{aligned}$$

implies  $\varphi_2(u_2) \in \ker \psi_3$ . Also we have  $\partial(\varphi_2(u_2)) = \overline{u'_1}$ , and so  $\overline{u'_1} \in \text{im} \partial$ . Thus  $\ker \overline{\varphi'_1} \subseteq \text{im} \partial$ . Conversely, let  $\overline{u'_1} \in \text{im} \partial$ . Choose  $u_3 \in M_3$  and  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$  and  $\psi_2(u_2) = \varphi'_1(u'_1)$ . It follows that

$$\begin{aligned}\overline{\varphi'_1(u'_1)} &= \overline{\varphi'_1(u'_1)} \\ &= \overline{\psi_2(u_2)} \\ &= \overline{0}\end{aligned}$$

in  $\text{coker} \psi_2$ . Thus  $\ker \overline{\varphi'_1} \supseteq \text{im} \partial$ .

Next we check exactness at  $\text{coker} \psi_2$ : let  $\overline{u'_2} \in \ker \overline{\varphi'_2}$ . Choose  $u_3 \in M_3$  such that  $\psi_3(u_3) = \varphi'_2(u'_2)$  and choose  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$ . Since

$$\begin{aligned}\varphi'_2(u'_2 - \psi_2(u_2)) &= \varphi'_2(u'_2) - \varphi'_2\psi_2(u_2) \\ &= \varphi'_2(u'_2) - \psi_3\varphi_2(u_2) \\ &= \varphi'_2(u'_2) - \psi_3(u_3) \\ &= \varphi'_2(u'_2) - \varphi'_2(u'_2) \\ &= 0,\end{aligned}$$

it follows that  $u'_2 - \psi_2(u_2) \in \ker \varphi'_2$ . Therefore there exists a unique  $u'_1 \in M'_1$  such that  $\varphi'_1(u'_1) = u'_2 - \psi_2(u_2)$  (by exactness of the bottom row in (3)). Then

$$\begin{aligned}\overline{\varphi'_1(u'_1)} &= \overline{\varphi'_1(u'_1)} \\ &= \overline{u'_2 - \psi_2(u_2)} \\ &= \overline{u'_2}\end{aligned}$$

in  $\text{coker} \psi_2$ . It follows that  $\overline{u'_2} \in \text{im} \overline{\varphi'_2}$  and hence  $\ker \overline{\varphi'_2} \subseteq \text{im} \overline{\varphi'_1}$ . Conversely, let  $\overline{u'_2} \in \text{im} \overline{\varphi'_2}$ . Choose  $u'_1 \in M'_1$  such that  $\varphi'_1(u'_1) = u'_2$ . Then

$$\begin{aligned}0 &= \varphi'_2\varphi'_1(u'_1) \\ &= \varphi'_2(u'_2)\end{aligned}$$

implies  $u'_2 \in \ker \varphi_2$ . Therefore  $\overline{\varphi'_2(u'_2)} = \overline{0}$  in  $\text{coker} \psi_3$ , and it follows that  $\ker \overline{\varphi'_2} \supseteq \text{im} \overline{\varphi'_1}$ .

Finally, we prove the moreover part of this proposition. Suppose that  $\varphi_1$  is injective. We want to show that  $\widetilde{\varphi}_1$  is injective. Let  $u_1 \in \ker \widetilde{\varphi}_1$ . Then

$$\begin{aligned}0 &= \widetilde{\varphi}_1(u_1) \\ &= \varphi_1(u_1)\end{aligned}$$

implies  $u_1 = 0$  since  $\varphi_1$  is injective. It follows that  $\widetilde{\varphi}_1$  is injective. Now suppose that  $\varphi'_2$  is surjective. We want to show that  $\overline{\varphi'_2}$  is surjective. Let  $\overline{u'_3} \in \text{coker} \psi_3$ . Since  $\varphi'_2$  is surjective, we may choose a  $u'_2 \in M'_2$  such that  $\varphi'_2(u'_2) = u'_3$ . Then

$$\begin{aligned}\overline{\varphi'_2(u'_2)} &= \overline{\varphi'_2(u'_2)} \\ &= \overline{u'_3}.\end{aligned}$$

It follows that  $\overline{\varphi'_2}$  is surjective. □

#### 2.2.4 Split Short Exact Sequences

Let  $M$  be an  $R$ -module and let  $N$  be an  $R$ -submodule of  $M$ . Then

$$0 \longrightarrow N \hookrightarrow M \longrightarrow M/N \longrightarrow 0 \quad (6)$$

is a short exact sequence. It turns out that a short exact sequence like (6) is isomorphic to a short exact sequence like (5) in the following way:

$$\begin{array}{ccccccc} 0 & \longrightarrow & N & \xrightarrow{f} & M & \xrightarrow{g} & P \longrightarrow 0 \\ & & \downarrow & & \downarrow id & & \downarrow \varphi \\ 0 & \longrightarrow & f(N) & \hookrightarrow & M & \longrightarrow & M/f(N) \longrightarrow 0 \end{array}$$

where the unlabelled arrows are the obvious ones and  $\varphi$  is defined as follows: Given  $p \in P$ , choose  $\tilde{p} \in M$  such that  $g(\tilde{p}) = p$ . Then set  $\varphi(p) = \tilde{p}$ . This is well-defined since if  $\tilde{p}' \in M$  was another lift of  $p$ , then  $g(\tilde{p} - \tilde{p}') = 0$  implies  $\tilde{p} - \tilde{p}' \in \text{Ker}(g) = \text{Im}(f)$ . So  $\tilde{p}' = f(k) + \tilde{p}$  for some  $k \in K$ , and hence  $\overline{\tilde{p}'} = \overline{f(k) + \tilde{p}} = \overline{\tilde{p}}$ . It is also easy to verify that all vertical arrows are in fact  $A$ -module isomorphisms.

**Example 2.4.** Let  $I$  and  $J$  be ideals in  $R$  such that  $I + J = R$ . Then there is a short exact sequence of  $R$ -modules given by

$$\begin{array}{ccccccc} 0 & \longrightarrow & I \cap J & \xrightarrow{\varphi} & I \oplus J & \xrightarrow{\psi} & R \longrightarrow 0 \\ & & x & \longmapsto & (x, -x) & & \\ & & & & (i, j) & \longmapsto & i + j \end{array}$$

**Definition 2.10.** A short exact sequence

$$0 \longrightarrow L \xrightarrow{\varphi} M \xrightarrow{\psi} N \longrightarrow 0$$

is called **split** when there is an  $R$ -module isomorphism  $\theta: M \rightarrow L \oplus N$  such that the diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & L & \xrightarrow{\varphi} & M & \xrightarrow{\psi} & N \longrightarrow 0 \\ & & \downarrow \text{id} & & \downarrow \theta & & \downarrow \text{id} \\ 0 & \longrightarrow & L & \xrightarrow{\iota_1} & L \oplus N & \xrightarrow{\pi_2} & N \longrightarrow 0 \end{array}$$

commutes, where the bottom maps to and from the direct sum are the standard embedding and projection; that is

$$\iota_1(u) = (u, 0) \quad \text{and} \quad \pi_2(u, v) = v$$

for all  $u \in L$  and  $(u, v) \in N$ .

**Theorem 2.3.** Let

$$0 \longrightarrow L \xrightarrow{\varphi} M \xrightarrow{\psi} N \longrightarrow 0$$

be a short exact sequence of  $R$ -modules. The following are equivalent:

1. There is an  $R$ -linear map  $\tilde{\varphi}: M \rightarrow L$  such that  $\tilde{\varphi}\varphi(u) = u$  for all  $u \in L$ .
2. There is an  $R$ -linear map  $\tilde{\psi}: N \rightarrow M$  such that  $\psi\tilde{\psi}(w) = w$  for all  $w \in N$ .
3. The short exact sequence splits.

*Proof.* We first show that (2) and (3) are equivalent. One direction is easy, so let us prove the other one. Suppose  $\tilde{\psi}: N \rightarrow M$  is an  $R$ -linear map such that  $\psi\tilde{\psi}(w) = w$  for all  $w \in N$ . Define  $\vartheta: L \oplus N \rightarrow M$  by

$$\vartheta(u, w) = \varphi(u) + \tilde{\psi}(w)$$

for all  $(u, w) \in L \oplus N$ . The map  $\vartheta$  is easily checked to be  $R$ -linear. We claim it is an isomorphism. Indeed, we first show that it is injective. Suppose  $(u, w) \in \ker \vartheta$ . Then  $-\varphi(u) = \tilde{\psi}(w)$ . Therefore

$$\begin{aligned} 0 &= -\psi\varphi(u) \\ &= \psi\tilde{\psi}(w) \\ &= w, \end{aligned}$$

which also implies

$$\begin{aligned} 0 &= -\psi\varphi(0) \\ &= -\psi\varphi(u) \\ &= \psi\tilde{\psi}(w) \\ &= w, \end{aligned}$$

and so  $(u, w) = (0, 0)$ . It follows that  $\vartheta$  is injective.

Now we will show  $\vartheta$  is surjective. Let  $v \in M$ . Observe that

$$\begin{aligned}\psi(v - \tilde{\psi}\psi(v)) &= \psi(v) - \psi\tilde{\psi}\psi(v) \\ &= \psi(v) - \psi(v) \\ &= 0.\end{aligned}$$

It follows that  $v - \tilde{\psi}\psi(v) \in \ker \psi$ . So we may choose a  $u \in L$  such that  $\varphi(u) = v - \tilde{\psi}\psi(v)$  by exactness of the short exact sequence. Then  $(u, \psi(v)) \in L \oplus N$ , and moreover we have

$$\begin{aligned}\vartheta(u, \psi(v)) &= \varphi(u) + \tilde{\psi}\psi(v) \\ &= v - \tilde{\psi}\psi(v) + \tilde{\psi}\psi(v) \\ &= v.\end{aligned}$$

It follows that  $\vartheta$  is surjective. Thus  $\vartheta^{-1}: L \oplus N \rightarrow M$  is an isomorphism. It remains to check that  $\vartheta^{-1}$  splits the short exact sequence. Let  $u \in L$ . Then  $u$  is the unique element in  $L$  which maps to  $\varphi(u)$  under  $\varphi$ , and so

$$\begin{aligned}\vartheta^{-1}\varphi(u) &= (u, \psi\varphi(u)) \\ &= (u, 0) \\ &= \iota_1(u).\end{aligned}$$

Thus the left square commutes. Similarly, let  $v \in M$  and let  $u$  be the unique element in  $L$  such that  $\varphi(u) = v - \tilde{\psi}\psi(v)$ . Then

$$\begin{aligned}\pi_2\vartheta^{-1}(v) &= \pi_2(u, \psi(v)) \\ &= \psi(v).\end{aligned}$$

Thus the right square commutes too. This concludes the proof that (2) and (3) are equivalent.

Now we will show that (1) and (3) are equivalent. One direction is easy, so let us prove the other one. Suppose  $\tilde{\varphi}: M \rightarrow L$  is an  $R$ -linear map such that  $\tilde{\varphi}\varphi(u) = u$  for all  $u \in L$ . Define a map  $\theta: M \rightarrow L \oplus N$  by

$$\theta(v) = (\tilde{\varphi}(v), \psi(v))$$

for all  $v \in M$ . The map  $\theta$  is easily checked to be  $R$ -linear. We claim it is an isomorphism. Indeed, we first show that it is injective. Suppose  $v \in \ker \theta$ . Then  $\tilde{\varphi}(v) = 0$  and  $\psi(v) = 0$ . So we may choose a  $u \in L$  such that  $\varphi(u) = v$  by exactness of the short exact sequence. Then

$$\begin{aligned}0 &= \varphi\tilde{\varphi}(v) \\ &= \varphi\tilde{\varphi}\varphi(u) \\ &= \varphi(u) \\ &= v.\end{aligned}$$

It follows that  $\theta$  is injective.

Now we will show  $\theta$  is surjective. Let  $(u, w) \in L \oplus N$ . Since  $\psi$  is surjective, we may choose a  $v \in M$  such that  $\psi(v) = w$ . Then  $v + \varphi(u - \tilde{\varphi}(v)) \in M$  and we have

$$\begin{aligned}\theta(v + \varphi(u - \tilde{\varphi}(v))) &= (\tilde{\varphi}(v + \varphi(u - \tilde{\varphi}(v))), \psi(v + \varphi(u - \tilde{\varphi}(v)))) \\ &= (\tilde{\varphi}(v) + \tilde{\varphi}\varphi(u) - \tilde{\varphi}\varphi\tilde{\varphi}(v), \psi(v) + \psi\varphi(u) - \psi\varphi\tilde{\varphi}(v)) \\ &= (\tilde{\varphi}(v) + u - \tilde{\varphi}(v), \psi(v)) \\ &= (u, w).\end{aligned}$$

It follows that  $\theta$  is surjective. □

We want to stress that being split is not just saying that there is an isomorphism  $M \rightarrow L \oplus N$  of  $R$ -modules, but *how* the isomorphism works with the maps  $f$  and  $g$  in the exact sequence: The commutativity of the diagram says  $\varphi: L \rightarrow M$  behaves like the standard embedding  $\iota_1: L \rightarrow L \oplus N$  and  $\psi: M \rightarrow N$  behaves like the standard projection  $\pi_2: L \oplus N \rightarrow N$ . Here is an example of a short exact sequence which does not split, even though we have  $M \cong L \oplus N$ .

**Example 2.5.** Define  $\varphi: \mathbb{Z} \rightarrow \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$  by

$$\varphi(a) = (2a, 0)$$

for all  $a \in \mathbb{Z}$  and define  $\psi: \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \rightarrow (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$  by

$$\psi(a, \overline{a_1}, \overline{a_2}, \dots) = (\overline{a}, \overline{a_1}, \overline{a_2}, \dots)$$

for all  $(a, \overline{a_1}, \overline{a_2}, \dots) \in \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$ . Then

$$0 \longrightarrow \mathbb{Z} \xrightarrow{\varphi} \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \xrightarrow{\psi} (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \longrightarrow 0$$

is a short exact sequence which does not split. Indeed, assume for a contradiction that it did split. Then there exists an  $R$ -linear map  $\tilde{\psi}: (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \rightarrow \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$  such that  $\psi\tilde{\psi} = 1$ . Let  $\pi_1: \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \rightarrow \mathbb{Z}$  be and  $\pi_2: \mathbb{Z} \oplus (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \rightarrow (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$  be the natural projection maps and denote  $\pi_1 \circ \tilde{\psi} = \tilde{\psi}_1$  and  $\pi_2 \circ \tilde{\psi} = \tilde{\psi}_2$ . First note that  $\tilde{\psi}_1: (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}} \rightarrow \mathbb{Z}$  must be the zero map since 2 is a nonzerodivisor on  $\mathbb{Z}$  and  $2 \in \text{Ann}((\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}})$ . Indeed, we have

$$\begin{aligned} 2\tilde{\psi}_1((\overline{a_n})) &= \tilde{\psi}_1((\overline{2a_n})) \\ &= \tilde{\psi}_1(0) \\ &= 0 \end{aligned}$$

implies  $\tilde{\psi}_1((\overline{a_n})) = 0$  for all  $(\overline{a_n}) \in (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$ . Now let  $(\overline{a_n}) \in (\mathbb{Z}/2\mathbb{Z})^{\mathbb{N}}$  with  $\overline{a_1} = \overline{1}$  and denote  $(b_n) = \tilde{\psi}_2((\overline{a_n}))$ . Then

$$\begin{aligned} (\overline{a_n}) &= \psi\tilde{\psi}((\overline{a_n})) \\ &= \psi(\tilde{\psi}_1((\overline{a_n})), \tilde{\psi}_2((\overline{a_n}))) \\ &= \psi(0, (b_n)) \\ &= (\overline{0}, \overline{b_1}, \overline{b_2}, \dots). \end{aligned}$$

This is a contradiction since  $\overline{a_1} = \overline{1}$ .

**Example 2.6.** Let  $I$  and  $J$  be ideals in  $R$  such that  $I + J = R$ . Then the short exact sequence given in Example (2.4) splits. Indeed, choose  $x \in I$  and  $y \in J$  such that  $x + y = 1$ . Define  $\tilde{\psi}: R \rightarrow I \oplus J$  by

$$\tilde{\psi}(a) = (ax, ay)$$

for all  $a \in R$ . The map  $\tilde{\psi}$  is easily checked to be an  $R$ -linear map. Moreover, we have

$$\begin{aligned} \psi\tilde{\psi}(a) &= \psi(ax, ay) \\ &= ax + ay \\ &= a(x + y) \\ &= a \end{aligned}$$

for all  $a \in R$ . Therefore  $\tilde{\psi}$  splits this short exact sequence. In particular, we obtain an isomorphism

$$(I \cap J) \oplus R \cong I \oplus J,$$

where the addition map  $I \oplus J \rightarrow R$  can now be viewed as a projection  $(I \cap J) \oplus R \rightarrow R$ .

If  $I \cap J$  happens to be a principal ideal in  $R$ , say  $I \cap J = \langle x \rangle$ , then there is an  $R$ -module isomorphism  $\mu_x: R \rightarrow I \cap J$  given by

$$\mu_x(a) = xa$$

for all  $a \in R$ . In particular, we obtain a sequence of isomorphisms

$$R \oplus R \cong (I \cap J) \oplus R \cong I \oplus J.$$

For example, in  $\mathbb{Z}[\sqrt{-5}]$  we have

$$\mathbb{Z}[\sqrt{-5}] \oplus \mathbb{Z}[\sqrt{-5}] \cong \langle 3, 1 + \sqrt{-5} \rangle \oplus \langle 3, 1 - \sqrt{-5} \rangle.$$

### 2.2.5 Splicing Short Exact Sequences Together

**Proposition 2.6.** Suppose for each  $i \in \mathbb{Z}$ , we are given short exact sequences of the form

$$0 \longrightarrow K_i \xrightarrow{\phi_i} M_i \xrightarrow{\psi_i} K_{i-1} \longrightarrow 0 \quad (7)$$

Then we can splice these short exact sequences together to get a long exact sequence of the form

$$\cdots \longrightarrow M_{i+1} \xrightarrow{\varphi_{i+1}} M_i \xrightarrow{\varphi_i} M_{i-1} \longrightarrow \cdots \quad (8)$$

where  $\varphi_i = \phi_{i-1} \circ \psi_i$ .

*Proof.* It follows the short exact sequences (6) that

$$\begin{aligned}\ker \varphi_i &= \ker(\phi_{i-1} \circ \psi_i) \\ &= \ker \psi_i \\ &= \operatorname{im} \phi_i \\ &= \operatorname{im}(\phi_i \circ \psi_{i+1}) \\ &= \operatorname{im} \varphi_{i+1}.\end{aligned}$$

It follows that (7) is exact.  $\square$

**Corollary.** Every long exact of  $R$ -modules can be formed by splicing together suitable short exact sequences.

*Proof.* Let

$$\cdots \longrightarrow M_{i+1} \xrightarrow{\varphi_{i+1}} M_i \xrightarrow{\varphi_i} M_{i-1} \longrightarrow \cdots \quad (9)$$

be an exact sequence of  $R$ -modules. For each  $i \in \mathbb{Z}$ , we break (8) into short exact sequences of the form

$$0 \longrightarrow \ker \varphi_i \xrightarrow{\iota_i} M_i \xrightarrow{\tilde{\varphi}_i} \operatorname{im} \varphi_i \longrightarrow 0 \quad (10)$$

where  $\iota_i$  is the inclusion map and  $\tilde{\varphi}_i$  is just  $\varphi_i$  but with range  $\operatorname{im} \varphi_i$  rather than  $M_{i-1}$ . In fact, since  $\ker \varphi_{i-1} = \operatorname{im} \varphi_i$ , we can rewrite (10) as

$$0 \longrightarrow \ker \varphi_i \xrightarrow{\iota_i} M_i \xrightarrow{\varphi_i} \ker \varphi_{i-1} \longrightarrow 0 \quad (11)$$

Since  $\varphi_i = \iota_{i-1} \circ \tilde{\varphi}_i$ , it follows from Proposition (2.6) that splicing these short exact sequences together gives us our original long exact sequence (8).  $\square$

### 2.3 Pullbacks and Pushouts

**Proposition 2.7.** Let  $M$ ,  $N$ , and  $P$  be  $R$ -modules, let  $\psi: N \rightarrow M$  be an  $R$ -linear map, and let  $\varphi: P \twoheadrightarrow M$  be a surjective  $R$ -linear map. Define the **pullback** of  $\psi: N \rightarrow M$  and  $\varphi: P \twoheadrightarrow M$  to be the  $R$ -module

$$N \times_M P = \{(u, v) \in N \times P \mid \psi(u) = \varphi(v)\}$$

equipped with the  $R$ -linear maps  $\pi_1: N \times_M P \rightarrow N$  and  $\pi_2: N \times_M P \rightarrow P$  given by

$$\pi_1(u, v) = u \quad \text{and} \quad \pi_2(u, v) = v$$

for all  $(u, v) \in N \times_M P$ . Then there exists an isomorphism  $\bar{\varphi}: P/\pi_1(N \times_M P) \rightarrow M/N$  given by

$$\bar{\varphi}(\bar{v}) = \overline{\varphi(v)}$$

for all  $\bar{v} \in P/\pi_1(N \times_M P)$ . Moreover, the following diagram commutative

$$\begin{array}{ccccccc} N \times_M P & \xrightarrow{\pi_2} & P & \longrightarrow & P/\pi_1(N \times_M P) & \longrightarrow & 0 \\ \downarrow \pi_1 & & \downarrow \varphi & & \downarrow \bar{\varphi} & & \\ N & \xrightarrow{\psi} & M & \longrightarrow & M/\psi(N) & \longrightarrow & 0 \end{array}$$

*Proof.* We first need to check that  $\bar{\varphi}$  is well-defined. Suppose  $v + v'$  is another representative of  $\bar{v}$  where  $v' \in \operatorname{im}(\pi_2)$ . Choose  $(u', v') \in N \times_M P$  such that  $\pi_1(u', v') = v'$  (so  $\varphi(v') = \psi(u')$ ). Then

$$\begin{aligned}\bar{\varphi}(\overline{v + v'}) &= \overline{\varphi(v + v')} \\ &= \overline{\varphi(v) + \varphi(v')} \\ &= \overline{\varphi(v) + \psi(u')} \\ &= \overline{\varphi(v)}.\end{aligned}$$

Thus  $\bar{\varphi}$  is well-defined. Clearly,  $\bar{\varphi}$  is a surjective  $R$ -linear map since  $\varphi$  is a surjective  $R$ -linear map. It remains to show that  $\bar{\varphi}$  is injective. Suppose  $\bar{v} \in \ker \bar{\varphi}$ . Then  $\varphi(v) \in \operatorname{im} \psi$ . Choose  $u \in N$  such that  $\psi(u) = \varphi(v)$ . Then  $(u, v) \in N \times_M P$  and  $v = \pi_2(u, v)$ . It follows that  $\bar{v} = 0$  in  $P/\pi_2(N \times_M P)$ .  $\square$

**Proposition 2.8.** Let  $M$ ,  $N$ , and  $E$  be  $R$ -modules, let  $\psi: M \rightarrow N$  be an  $R$ -linear map, and let  $\varphi: M \rightarrow E$  be an injective  $R$ -linear map. Define the **pushout of  $\psi: M \rightarrow N$  and  $\varphi: M \rightarrow E$**  to be the  $R$ -module

$$E +_M N = E \times N / \{(\psi(w), -\varphi(w)) \mid w \in M\}$$

equipped with the  $R$ -linear maps  $\iota_1: E \rightarrow E +_M N$  and  $\iota_2: N \rightarrow E +_M N$  given by

$$\iota_1(u) = (u, 0) \quad \text{and} \quad \iota_2(v) = (0, v)$$

for all  $u \in E$  and  $v \in N$ . Then  $\varphi$  restricts to an isomorphism  $\varphi|_{\ker \psi}: \ker \psi \rightarrow \ker \iota_1$ . Moreover, the following diagram commutative is commutative

$$\begin{array}{ccccccc} 0 & \longrightarrow & \ker \psi & \longrightarrow & M & \xrightarrow{\psi} & N \\ & & \downarrow \varphi|_{\ker \psi} & & \downarrow \varphi & & \downarrow \iota_2 \\ 0 & \longrightarrow & \ker \iota_1 & \longrightarrow & E & \xrightarrow{\iota_1} & E +_M N \end{array}$$

*Proof.* We first need to check that the restriction of  $\varphi$  to  $\ker \psi$  lands in  $\ker \iota_1$ . Suppose  $w \in \ker \psi$ . Then observe that

$$\begin{aligned} \iota_1 \varphi(w) &= [\varphi(w), 0] \\ &= [0, -\psi(w)] \\ &= [0, 0], \end{aligned}$$

where we write  $[u, v]$  for the equivalence class of  $(u, v)$  in  $E +_M N$ . It follows that  $\varphi(w) \in \ker \iota_1$ . Thus the map  $\varphi|_{\ker \psi}: \ker \psi \rightarrow \ker \iota_1$  makes sense.

Clearly,  $\varphi|_{\ker \psi}$  is an injective  $R$ -linear map since  $\varphi$  is an injective  $R$ -linear map. It remains to show that  $\varphi|_{\ker \psi}$  is surjective. Suppose  $u \in \ker \iota_1$  (so  $[u, 0] = [0, 0]$ ). This implies that there exists a  $w \in M$  such that  $u = \varphi(w)$  and  $\psi(w) = 0$ . In other words, this implies the map  $\varphi|_{\ker \psi}$  is surjective.  $\square$

## 3 Modules over a PID

### 3.1 Annihilators and Torsion

**Definition 3.1.** Let  $R$  be an integral domain, let  $M$  be an  $R$ -module, and let  $u \in M$ . We define the **annihilator** of  $u$  to be

$$0 :_R u = \{a \in R \mid au = 0\}.$$

We say  $0 :_R u$  is the set of all elements in  $R$  which **kills**  $u$ . If  $0 :_R u \neq 0$ , then we say  $u$  is a **torsion element** in  $M$ . We denote by  $M_{\text{tor}}$  to be the set of all torsion elements in  $M$ . We say  $M$  is **torsion-free** if  $M_{\text{tor}} = 0$ , that is, the only torsion element in  $M$  is 0. We say  $M$  is **torsion** if  $M_{\text{tor}} = M$ , that is, every element in  $M$  is a torsion element.

**Proposition 3.1.** Let  $R$  be an integral domain, let  $M$  be an  $R$ -module, and let  $u \in M$ . Then  $0 :_R u$  is an ideal in  $R$  and  $M_{\text{tor}}$  is a  $R$ -submodule of  $M$ .

*Proof.* We first show that  $0 :_R u$  is an ideal in  $R$ . Observe that  $0 \in 0 :_R u$  which implies  $0 :_R u$  is nonempty. Let  $x, y \in 0 :_R u$  and let  $a \in R$ . Then

$$\begin{aligned} (ax + y)u &= axu + yu \\ &= 0 + 0 \\ &= 0 \end{aligned}$$

implies  $ax + y \in 0 :_R u$ . It follows that  $0 :_R u$  is an ideal in  $R$ .

Now we will show that  $M_{\text{tor}}$  is an  $R$ -submodule of  $M$ . Observe that  $0 \in M_{\text{tor}}$  which implies  $M_{\text{tor}}$  is nonempty. Let  $u, v \in M_{\text{tor}}$  and let  $a \in R$ . Choose  $x, y \in R \setminus \{0\}$  such that  $xu = 0$  and  $yv = 0$ . Then  $xy \neq 0$  since  $R$  is an integral domain, and moreover we have

$$\begin{aligned} xy(au + v) &= xyau + xyv \\ &= ya(xu) + x(yv) \\ &= 0 + 0 \\ &= 0, \end{aligned}$$

which implies  $0 :_R (au + v) \neq 0$ . It follows that  $au + v \in M_{\text{tor}}$ , which implies  $M_{\text{tor}}$  is an  $R$ -submodule of  $M$ .  $\square$

**Proposition 3.2.** Let  $R$  be a PID, let  $p$  be a prime in  $R$ , let  $M$  be an  $R$ -module, and let  $u \in M$ . Suppose  $p^k u = 0$  for some  $k \geq 0$ . Then

$$0 :_R u = \langle p^i \rangle$$

for some  $0 \leq i \leq k$ .

*Proof.* Choose  $i \geq 0$  to be the smallest integer such that  $p^i u = 0$ . We claim that  $\langle p^i \rangle = 0 :_R u$ . Since  $p^i \in 0 :_R u$ , we certainly have  $0 :_R u \supseteq \langle p^i \rangle$ . If  $0 :_R u \supseteq \langle q^j \rangle$  for some other prime  $q \neq p$ , then

$$\begin{aligned} 0 :_R u &\supseteq \langle p^i, q^j \rangle \\ &= \langle 1 \rangle \end{aligned}$$

since  $\gcd(p^i, q^j) = 1$ . In this case,  $i = 0$ . Otherwise,  $i \neq 0$  and  $0 :_R u = \langle p^i \rangle$ .  $\square$

### 3.2 Embedding finitely generated torsion-free module in $R^d$

**Lemma 3.1.** Every finitely generated torsion-free module  $M$  over an integral domain  $R$  can be embedded in a finite free  $R$ -module. More precisely, if  $M \neq 0$ , then there is an embedding  $M \hookrightarrow R^d$  for some  $d \geq 1$  such that the image of  $M$  intersects the standard coordinate axis of  $R^d$ .

*Proof.* Let  $K$  be the fraction field of  $R$  and  $u_1, \dots, u_n$  be a generating set for  $M$  as an  $R$ -module. We will show  $n$  is an upper bound on the size of any  $R$ -linearly independent subset of  $M$ . Let  $\varphi: R^n \rightarrow M$  be the linear map given by

$$\varphi(e_i) = u_i$$

for all  $1 \leq i \leq n$ . Let  $v_1, \dots, v_k$  be linearly independent in  $M$ . Choose  $\tilde{v}_1, \dots, \tilde{v}_k \in R^n$  such that

$$\varphi(\tilde{v}_j) = v_j$$

for all  $1 \leq j \leq k$ . We claim that  $\{\tilde{v}_1, \dots, \tilde{v}_k\}$  is linearly independent. Indeed, suppose

$$a_1 \tilde{v}_1 + \dots + a_k \tilde{v}_k = 0 \tag{12}$$

for some  $a_1, \dots, a_k \in R$ . Then applying  $\varphi$  to both sides of (12) gives us

$$a_1 v_1 + \dots + a_k v_k = 0$$

which implies  $a_1 = \dots = a_k = 0$  since  $\{v_1, \dots, v_k\}$  is linearly independent. Therefore  $\{\tilde{v}_1, \dots, \tilde{v}_k\}$  is linearly independent. In fact, we claim that  $\{\tilde{v}_1, \dots, \tilde{v}_k\}$  is  $K$ -linearly independent in  $K^n$ . Indeed, suppose

$$x_1 \tilde{v}_1 + \dots + x_k \tilde{v}_k = 0 \tag{13}$$

for some  $x_1, \dots, x_k \in K$ . Let  $d \in R$  be the common denominator of  $x_1, \dots, x_k$ . Then multiplying  $d$  to both sides of (13) gives us

$$(dx_1) \tilde{v}_1 + \dots + (dx_k) \tilde{v}_k = 0$$

which implies  $dx_1 = \dots = dx_k = 0$  since  $\{\tilde{v}_1, \dots, \tilde{v}_k\}$  is  $R$ -linearly independent. This further implies  $x_1 = \dots = x_k = 0$  since  $d \neq 0$  and  $R$  is an integral domain. Thus  $\{\tilde{v}_1, \dots, \tilde{v}_k\}$  is  $K$ -linearly independent in  $K^n$ . Now it follows from linear algebra over fields that  $k \leq n$ .

From the bound  $k \leq n$ , there is a linearly independent subset of  $M$  with maximal size, say  $w_1, \dots, w_d$ . Then

$$\sum_{j=1}^d R w_j \cong R^d.$$

We will find a scalar multiple of  $M$  inside of this. For any  $u \in M$ , the set  $\{u, w_1, \dots, w_d\}$  is linearly independent by maximality of  $d$ , so there is a nontrivial relation

$$au + \sum_{i=1}^d a_i w_i = 0,$$

where  $a, a_1, \dots, a_d \in R$ , necessarily with  $a \neq 0$ . Thus

$$au \in \sum_{j=1}^d R w_j.$$

In particular, for each  $1 \leq i \leq n$ , there exists a nonzero  $a_i \in R$  such that

$$a_i u_i \in \sum_{j=1}^d R w_j.$$

Setting  $a = a_1 \cdots a_n$  and using the fact that  $R$  is an integral domain and  $M$  is torsion free, we see that

$$a u_i \in \sum_{j=1}^d R w_j$$

for all  $i$ . So  $aM \subseteq \sum_{j=1}^d R w_j$ . Since  $R$  is an integral domain, multiplying by  $a$  is an isomorphism of  $M$  with  $aM$ , so we have the sequence of  $R$ -linear maps

$$\begin{aligned} M &\rightarrow aM \\ &\hookrightarrow \sum_{j=1}^d R w_j \\ &\rightarrow R^d \end{aligned}$$

where the last map is an isomorphism. □

### 3.3 Submodules of a finite free module over a PID

**Theorem 3.2.** *When  $R$  is a PID, any submodule of a free  $R$ -module of rank  $n$  is free of rank  $\leq n$ .*

*Proof.* We may assume the free  $R$ -module is literally  $R^n$  and will induct on  $n$ . The case where  $n = 1$  is true since  $R$  is a PID: every  $R$ -submodule of  $R$  is an ideal, hence of the form  $Ra$  since all ideals in  $R$  are principal, and  $Ra \cong R$  as  $R$ -modules when  $a \neq 0$  since  $R$  is an integral domain. Say  $n \geq 1$  and the theorem is proved for  $R^n$ . Let  $M \subseteq R^{n+1}$  be a submodule. We want to show  $M$  is free of rank  $\leq n + 1$ . View

$$M \subseteq R^{n+1} = R \oplus R^n$$

and let  $\pi: R \oplus R^n \rightarrow R^n$  be the projection to the second component of this direct sum. Then

$$N = \pi(M) \subseteq R^n$$

is free of rank  $\leq n$  by the induction hypothesis. Since  $\pi$  maps  $M$  onto  $N$  and  $N$  is free (and hence projective), we have

$$M \cong N \oplus \ker \pi|_M$$

and  $\ker \pi|_M = M \cap (R \oplus 0)$ . All submodules of  $R \oplus 0 \cong R$  are free of rank  $\leq 1$ . Thus  $N \oplus \ker \pi|_M$  is free of rank  $\leq n + 1$ , so  $M$  is as well. □

*Remark.* Using Zorn's Lemma, one can show that Theorem (3.2) holds for non-finitely generated free modules too: any submodule of a free module over a PID is free.

**Corollary.** *When  $R$  is a PID, every finitely generated torsion-free  $R$ -module is a finite free  $R$ -module.*

*Proof.* By Lemma (3.1), such a module embeds into a finite free  $R$ -module, so it is finite free too by Theorem (3.2). □

**Corollary.** *Let  $R$  be a PID. Let  $M, M', M''$  be  $R$ -modules such that*

$$M'' \subseteq M' \subseteq M$$

*and such that  $M \cong R^n \cong M''$ . Then  $M' \cong R^n$ .*

*Proof.* Since  $M$  is free of rank  $n$  and  $M'$  is a submodule, Theorem (3.2) tells us that  $M' \cong R^m$  with  $m \leq n$ . Using Theorem (3.2) again on  $M''$  as a submodule of  $M'$ , we see that  $M'' \cong R^k$  with  $k \leq m$ . By hypothesis,  $M'' \cong R^n$ . Therefore  $k = n$  since  $R$  is commutative and hence  $m = n$ . □

### 3.4 Finitely generated modules over PID is isomorphic to free + torsion

**Corollary.** Let  $R$  be a PID and let  $M$  be a finitely generated  $R$ -module. Then

$$M \cong F \oplus M_{\text{tor}}$$

where  $F$  is free.

*Proof.* Observe that  $M/M_{\text{tor}}$  is torsion-free and finitely generated as an  $R$ -module. Indeed, it is torsion-free since if  $au \in M_{\text{tor}}$  for some  $a \neq 0$ , then  $u \in M_{\text{tor}}$  since  $R$  is an integral domain. It is finitely generated since it is the homomorphic image of a finitely generated module. Therefore by the previous theorem,  $M/M_{\text{tor}}$  is free. Therefore the short exact sequence

$$0 \longrightarrow M_{\text{tor}} \longrightarrow M \longrightarrow M/M_{\text{tor}} \longrightarrow 0$$

splits. Thus  $M \cong F \oplus M_{\text{tor}}$  where  $F = M/M_{\text{tor}}$  is free.  $\square$

**Theorem 3.3.** Let  $R$  be a PID and let  $M$  be a torsion  $R$ -module. For any prime  $p$  in  $R$ , set

$$\Gamma_p(M) = \bigcup_{k \geq 0} (0 :_M p^k) = \{u \in M \mid p^k u = 0 \text{ for some } k \geq 0\}.$$

Then

$$M \cong \bigoplus_{p \text{ prime}} \Gamma_p(M).$$

Furthermore, if  $M$  is finitely-generated, then  $\Gamma_p(M) = 0$  for all but finitely many  $p$ .

*Proof.* Suppose  $0 \neq a \in A$ . Then there exists  $0 \neq r \in R$  such that  $ra = 0$ . Write

$$r = p_1^{b_1} \cdots p_k^{b_k}.$$

Now observe that

$$\begin{aligned} (p_2^{b_2} p_3^{b_3} \cdots p_k^{b_k})a &\in A_{p_2} \\ (p_1^{b_1} p_3^{b_3} \cdots p_k^{b_k})a &\in A_{p_3} \\ &\vdots \\ (p_1^{b_1} p_2^{b_2} \cdots p_{k-1}^{b_{k-1}})a &\in A_{p_k} \end{aligned}$$

We claim that  $a \in A_{p_1} + A_{p_2} \cdots + A_{p_k}$ . Indeed,

$$\gcd(p_2^{b_2} p_3^{b_3} \cdots p_k^{b_k}, p_1^{b_1} p_3^{b_3} \cdots p_k^{b_k}, \dots, p_1^{b_1} p_2^{b_2} \cdots p_{k-1}^{b_{k-1}}) = 1.$$

Thus there exists  $r_1, r_2, \dots, r_k$  such that

$$\sum r_i p_1^{b_1} \cdots \widehat{p_i^{b_i}} \cdots p_k^{b_k} = 1.$$

Therefore

$$\begin{aligned} a &= \sum r_i p_1^{b_1} \cdots \widehat{p_i^{b_i}} \cdots p_k^{b_k} a \\ &\in A_{p_1} + A_{p_2} \cdots + A_{p_k}. \end{aligned}$$

To see that the sum is direct, suppose  $a \in A_p \cap \sum_{q \neq p} A_q$ . Choose  $k \in \mathbb{N}$  such that  $p^k a = 0$  and choose  $a_{q_i} \in A_{q_i}$  with  $q_i^{k_i} a = 0$  such that

$$a = a_{q_1} + \cdots + a_{q_m}.$$

If  $\alpha = \prod_{i=1}^m q_i^{k_i}$ , then  $p^k a = 0$  and  $\alpha a = 0$ . Since  $\gcd(\alpha, p^k) = 1$ , we see that  $a$  is killed by all of  $R$ . Thus  $a = 0$  since  $1 \in R$ .  $\square$

### 3.5 Aligned Bases

There is a convenient way of picturing any submodule of a finite free module over a PID: bases can be chosen for the module and submodule that are aligned nicely, as follows.

**Definition 3.2.** Let  $R$  be a PID, let  $M$  be a finite free  $R$ -module, and let  $M'$  be a submodule of  $M$ . A basis  $\{u_1, \dots, u_n\}$  of  $M$  and a basis  $\{a_1u_1, \dots, a_mu_m\}$  of  $M'$  with  $a_i \in R \setminus \{0\}$  and  $m \leq n$  is called a pair of **aligned bases**.

**Theorem 3.4.** Any finite free  $R$ -module  $M$  of rank  $n \geq 1$  and nonzero submodule  $M'$  of rank  $m \leq n$  admit a pair of aligned bases: there is a basis  $u_1, \dots, u_n$  of  $M$  and nonzero  $a_1, \dots, a_m \in R$  such that

$$M = \bigoplus_{i=1}^n Ru_i \quad \text{and} \quad M' = \bigoplus_{j=1}^m Ra_ju_j.$$

*Proof.* Define  $S$  to be the set of ideals  $\varphi(M')$  where  $\varphi: M \rightarrow R$  is  $R$ -linear. This includes nonzero ideals; for example, let  $M$  have  $R$ -basis  $\{e_1, \dots, e_n\}$ . Choose any nonzero  $u' \in M'$  and write

$$u' = a_1e_1 + \dots + a_ne_n.$$

Then since  $u' \neq 0$ , we must have  $a_i \neq 0$  for some  $i$ , and so  $e_i^*(u') = a_i$  is nonzero. Hence  $e_i^*(M') \neq 0$ .

Any nonzero ideal in  $R$  is contained in only finitely many ideals since  $R$  is a PID, so  $S$  contains maximal members with respect to inclusion. Call one of these maximal members  $Ra_1$ , so  $a_1 \neq 0$ . Thus  $Ra_1 = \varphi_1(M')$  for some linear map  $\varphi_1: M \rightarrow R$ . There exists some  $v' \in M'$  such that

$$a_1 = \varphi_1(v').$$

Eventually we are going to show that  $\varphi_1$  takes the value 1 on  $M$ .

We claim that for any linear map  $\varphi: M \rightarrow R$ , we have  $a_1 \mid \varphi(v')$ . To show this, set  $\varphi(v') = a_\varphi \in R$ . Since  $R$  is a PID, we have  $Ra_1 + Ra_\varphi = Rd$  for some  $d$ , so  $Ra_1 \subseteq Rd$ . Then there exists  $x, y \in R$  such that  $d = xa_1 + ya_\varphi$ . Thus

$$\begin{aligned} d &= xa_1 + ya_\varphi \\ &= x\varphi_1(v') + y\varphi(v') \\ &= (x\varphi_1 + y\varphi)(v'), \end{aligned}$$

and so  $dR \subseteq (x\varphi_1 + y\varphi)(M') \in S$ . Hence

$$\begin{aligned} \varphi_1(M') &= Ra_1 \\ &\subseteq Rd \\ &\subseteq (x\varphi_1 + y\varphi)(M'). \end{aligned}$$

Since  $x\varphi_1 + y\varphi$  is a linear map  $M \rightarrow R$ , it belongs to  $S$ , so maximality of  $\varphi_1(M')$  in  $S$  implies

$$\begin{aligned} \varphi_1(M') &= (x\varphi_1 + y\varphi)(M') \\ &= Rd. \end{aligned}$$

Hence

$$\begin{aligned} Ra_1 &= Rd \\ &= Ra_1 + Ra_\varphi, \end{aligned}$$

which implies  $a_\varphi \in R$ , and so  $a_1 \mid a_\varphi$ .

With the claim proved, we are ready to build aligned bases in  $M$  and  $M'$ . Letting  $\{e_1, \dots, e_n\}$  be a basis for  $M$ , we have

$$v' = c_1e_1 + \dots + c_ne_n$$

for some  $c_i \in R$ . The  $i$ th coordinate function for this basis is a linear map  $M \rightarrow R$  taking the value  $c_i$  at  $v'$ , and so  $c_i$  is a multiple of  $a_1$  by our claim. Writing  $c_i = a_1b_i$ , we have

$$\begin{aligned} v' &= \sum_{i=1}^n c_ie_i \\ &= \sum_{i=1}^n a_1b_ie_i \\ &= a_1(b_1e_1 + \dots + b_ne_n) \\ &= a_1v_1, \end{aligned}$$

say. Then

$$\begin{aligned} a_1 &= \varphi_1(v') \\ &= \varphi_1(a_1 v_1) \\ &= a_1 \varphi_1(v_1), \end{aligned}$$

and so  $\varphi_1(v_1) = 1$ . We have found an element of  $M$  at which  $\varphi_1$  takes the value 1.

The module  $M$  can be written as  $Rv_1 + \ker \varphi_1$  since any  $v \in M$

$$v = \varphi_1(v)v_1 + (v - \varphi_1(v))v_1.$$

Also  $Rv_1 \cap \ker \varphi_1$ . Thus  $M = Rv_1 \oplus \ker \varphi_1$ . Since  $M$  is free of rank  $n$  its submodule  $\ker \varphi_1$  is free and necessarily of rank  $n - 1$ .

How does  $M'$  fit in this decomposition of  $M$ ? For any  $w \in M'$  we have

$$w = \varphi_1(w)v_1 + (w - \varphi_1(w)v_1)$$

and the first term is

$$\begin{aligned} \varphi_1(w)v_1 &\in \varphi_1(M')v_1 \\ &= (Ra_1)v_1 \\ &= Ra_1v_1 \\ &= Rv' \\ &\subseteq M', \end{aligned}$$

so  $w - \varphi_1(w)v_1 \in M'$  too. Therefore

$$M' = (M' \cap Rv_1) \oplus (M' \cap \ker \varphi_1).$$

So  $M = Rv_1 \oplus \ker \varphi_1$  and  $M' = Ra_1v_1 \oplus (M' \cap \ker \varphi_1)$ . The last equation tells us  $M' \cap \ker \varphi_1$  is free of rank  $m - 1$  since  $M'$  is free of rank  $m$ . If  $m = 1$  then we're done. If  $m > 1$ , then we can describe how  $M' \cap \ker \varphi_1$  sits in  $\ker \varphi_1$  by induction on the rank: we have a basis  $v_2, \dots, v_n$  of  $\ker \varphi_1$  and  $a_2, \dots, a_m \in R \setminus \{0\}$  such that  $a_2v_2, \dots, a_mv_m$  is a basis of  $M' \cap \ker \varphi_1$ .  $\square$

## 4 Tensor Products

### 4.1 Definition of Tensor Products via UMP

**Definition 4.1.** Let  $M$  and  $N$  be  $R$ -modules. The **tensor product**  $M \otimes_R N$  is an  $R$ -module equipped with a bilinear map  $\otimes: M \times N \rightarrow M \otimes_R N$  such that for each bilinear map  $B: M \times N \rightarrow P$  there is a unique linear map  $L: M \otimes_R N \rightarrow P$  making the following diagram commute.

$$\begin{array}{ccc} & & M \otimes_R N \\ & \nearrow \otimes & \downarrow L \\ M \times N & & P \\ & \searrow B & \end{array}$$

Let  $R$ -modules  $T$  and  $T'$ , and bilinear maps  $b: M \times N \rightarrow T$  and  $b': M \times N \rightarrow T'$ , satisfy the universal mapping property of the tensor product. From universality of  $b: M \times N \rightarrow T$ , the map  $b': M \times N \rightarrow T'$  factors uniquely through  $T$ : there exists a unique linear map  $f: T \rightarrow T'$  making

$$\begin{array}{ccc} & & T \\ & \nearrow b & \downarrow f \\ M \times N & & T' \\ & \searrow b' & \end{array} \tag{14}$$

commute. From universality of  $b': M \times N \rightarrow T'$ , the map  $b: M \times N \rightarrow T$  factors uniquely through  $T'$ : there exists a unique linear map  $f': T' \rightarrow T$  making

$$\begin{array}{ccc} & & T' \\ & \nearrow b' & \vdots f' \\ M \times N & & \\ & \searrow b & \downarrow \\ & & T \end{array} \quad (15)$$

commute. We combine (15) and (14) into the commutative diagram

$$\begin{array}{ccccc} & & T & & \\ & \nearrow b & \downarrow f & & \\ & M \times N & \xrightarrow{b'} T' & & \\ & \searrow b & \downarrow f' & & \\ & & T & & \end{array} \quad (16)$$

Removing the middle, we have the commutative diagram

$$\begin{array}{ccc} & T & \\ & \downarrow f' \circ f & \\ M \times N & & T \end{array} \quad (17)$$

From universality of  $(T, b)$ , a unique linear map  $T \rightarrow T$  fits in (16). The identity map works, so  $f' \circ f = 1_T$ . Similarly,  $f \circ f' = 1_{T'}$  by stacking (15) and (14) in the other order. Thus  $T$  and  $T'$  are isomorphic  $R$ -modules by  $f$  and also  $f \circ b = f'$ , which means  $f$  identifies  $b$  with  $b'$ . So two tensor products of  $M$  and  $N$  can be identified with each other in a unique way compatible with the distinguished bilinear maps to them from  $M \times N$ .

## 4.2 Construction of Tensor Product

**Theorem 4.1.** *A tensor product of  $M$  and  $N$  exists.*

*Proof.* Consider  $M \times N$  simply as a set. We form the free  $R$ -module on this set:

$$F_R(M \times N) = \bigoplus_{(u,v) \in M \times N} R\delta_{(u,v)}.$$

Let  $D$  be the submodule of  $F_R(M \times N)$  □

## 4.3 The Covariant Functor $-\otimes_R N$

**Proposition 4.1.** *Let  $N$  be an  $R$ -module. We obtain a covariant functor*

$$-\otimes_R N: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_R$$

*from the category of  $R$ -modules to itself, where the  $R$ -module  $M$  is assigned to the  $R$ -module  $M \otimes_R N$  and where the  $R$ -linear map  $\varphi: M \rightarrow M'$  is assigned to the  $R$ -linear map  $\varphi \otimes 1: M \otimes_R N \rightarrow M' \otimes_R N$ , where  $\varphi \otimes 1$  is defined by*

$$(\varphi \otimes 1)(u \otimes v) = \varphi(u) \otimes v$$

*for all elementary tensors  $u \otimes v \in M \otimes_R N$ .*

*Proof.* We need to check that  $-\otimes_R N$  preserves compositions and identities. We first check that it preserves compositions. Let  $\varphi: M \rightarrow M'$  and  $\varphi': M' \rightarrow M''$  be two  $R$ -linear maps and let  $u \otimes v$  be an elementary tensor in

$M \otimes_R N$ . Then

$$\begin{aligned} ((\varphi' \otimes 1)(\varphi \otimes 1))(u \otimes v) &= (\varphi' \otimes 1)((\varphi \otimes 1)(u \otimes v)) \\ &= (\varphi' \otimes 1)(\varphi(u) \otimes v) \\ &= (\varphi'(\varphi(u)) \otimes v) \\ &= (\varphi' \varphi)(u) \otimes v \\ &= (\varphi' \varphi \otimes 1)(u \otimes v). \end{aligned}$$

It follows that  $(\varphi' \otimes 1)(\varphi \otimes 1) = \varphi' \varphi \otimes 1$ . Hence  $- \otimes_R N$  preserves compositions. Next we check that  $- \otimes_R N$  preserves identities. Let  $M$  be an  $R$ -module and  $u \otimes v$  be an elementary tensor in  $M \otimes_R N$ . Then we have

$$\begin{aligned} (1_M \otimes 1)(u \otimes v) &= 1_M(u) \otimes v \\ &= u \otimes v \\ &= 1_{M \otimes_R N}(u \otimes v). \end{aligned}$$

It follows that  $1_M \otimes 1 = 1_{M \otimes_R N}$ . Hence  $- \otimes_R N$  preserves identities.  $\square$

#### 4.3.1 Right Exactness of $- \otimes_R N$

**Proposition 4.2.** *The sequence of  $R$ -modules and  $R$ -linear maps*

$$M_1 \xrightarrow{\varphi_1} M_2 \xrightarrow{\varphi_2} M_3 \longrightarrow 0 \quad (18)$$

*is exact if and only if for all  $R$ -modules  $N$  the induced sequence*

$$M_1 \otimes_R N \xrightarrow{\varphi_1 \otimes N} M_2 \otimes_R N \xrightarrow{\varphi_2 \otimes N} M_3 \otimes_R N \longrightarrow 0 \quad (19)$$

*is exact.*

*Proof.* The sequence

$$M_1 \otimes_R N \longrightarrow M_2 \otimes_R N \longrightarrow M_3 \otimes_R N \longrightarrow 0 \quad (20)$$

is exact for all  $R$ -modules  $N$  if and only if for all  $R$ -modules  $N$  and  $P$  the induced sequence

$$0 \longrightarrow \text{Hom}_R(M_3 \otimes_R N, P) \longrightarrow \text{Hom}_R(M_2 \otimes_R N, P) \longrightarrow \text{Hom}_R(M_1 \otimes_R N, P) \quad (21)$$

is exact by Proposition (??). Then (20) is exact for all  $R$ -modules  $N$  and  $P$  if and only if the sequence

$$0 \rightarrow \text{Hom}_R(M_3, \text{Hom}_R(N, P)) \rightarrow \text{Hom}_R(M_2, \text{Hom}_R(N, P)) \rightarrow \text{Hom}_R(M_1, \text{Hom}_R(N, P)) \quad (22)$$

is exact for all  $R$ -modules  $N$  and  $P$ , by tensor-hom adjointness. Then (21) is exact for all  $R$ -modules  $N$  and  $P$  if and only if for all  $R$ -modules  $K$

$$0 \longrightarrow \text{Hom}_R(M_3, K) \longrightarrow \text{Hom}_R(M_2, K) \longrightarrow \text{Hom}_R(M_1, K) \quad (23)$$

is exact since any  $R$ -module  $K$  is isomorphic to an  $R$ -module of the form  $\text{Hom}_R(N, P)$  (take  $N = R$  and  $P = K$ ) and because of naturality of  $\text{Hom}$  as in (6.5). Finally, (23) is exact if and only if

$$M_1 \longrightarrow M_2 \longrightarrow M_3 \longrightarrow 0 \quad (24)$$

is exact again by Proposition (??).  $\square$

## 4.4 Tensor Product Properties

### 4.4.1 Tensor product of finitely presented $R$ -modules is finitely presented

**Proposition 4.3.** *Let  $M$  be an  $N$  be finitely presented  $R$ -modules with presentations*

$$F_1 \xrightarrow{\varphi_1} F_0 \xrightarrow{\varphi_0} M \rightarrow 0 \quad \text{and} \quad G_1 \xrightarrow{\psi_1} G_0 \xrightarrow{\psi_0} N \rightarrow 0.$$

*Then*

$$(F_1 \otimes_R G_0) \oplus (F_0 \otimes_R G_1) \xrightarrow{\phi_1} F_0 \otimes_R G_0 \xrightarrow{\phi_0} M \otimes_R N \rightarrow 0 \quad (25)$$

is a presentation of  $M \otimes_R N$ , where  $\phi_0$  is defined by

$$\phi_0(u_0 \otimes v_0) = \varphi_0(u_0) \otimes v_0 - u_0 \otimes \psi_0(v_0)$$

for all elementary tensors  $u_0 \otimes v_0 \in F_0 \otimes_R G_0$ , and where  $\phi_1$  is defined by

$$\phi_1(u_1 \otimes v_0) = \varphi_1(u_1) \otimes v_0 \quad \text{and} \quad \phi_1(u_0 \otimes v_1) = u_0 \otimes \psi_1(v_1)$$

for all  $u_1 \otimes v_0 \in F_1 \otimes_R G_0$  and  $u_0 \otimes v_1 \in F_0 \otimes_R G_1$ .

*Proof.* The assignment

$$(u_0, v_0) \mapsto \varphi_0(u_0) \otimes v_0 - u_0 \otimes \psi_0(v_0)$$

is  $R$ -bilinear and thus  $\phi_0$  is a well-defined  $R$ -linear map. Similarly, the assignments

$$(u_1, v_0) \mapsto \varphi_1(u_1) \otimes v_0 \quad \text{and} \quad (u_0, v_1) \mapsto u_0 \otimes \psi_1(v_1)$$

are  $R$ -bilinear and thus  $\phi_1$  is a well-defined  $R$ -linear map. Let us check that (??) is exact.  $\square$

#### 4.4.2 Tensor product commutes with direct sums

**Proposition 4.4.** *Let  $M$  be an  $R$  module and let  $\{L_i\}$  be a collection of  $R$ -modules indexed over a set  $I$ . Then*

$$\left( \bigoplus_{i \in I} L_i \right) \otimes_R M \cong \bigoplus_{i \in I} (L_i \otimes_R M).$$

*Proof.* For all  $R$ -modules  $N$ , we have

$$\begin{aligned} \text{Hom}_R \left( \left( \bigoplus_{i \in I} L_i \right) \otimes_R M, N \right) &\cong \text{Hom}_R \left( \bigoplus_{i \in I} L_i, \text{Hom}_R(M, N) \right) \\ &\cong \prod_{i \in I} \text{Hom}_R(L_i, \text{Hom}_R(M, N)) \\ &\cong \prod_{i \in I} \text{Hom}_R(L_i \otimes_R M, N) \\ &\cong \text{Hom}_R \left( \bigoplus_{i \in I} (L_i \otimes_R M), N \right). \end{aligned}$$

It follows that

$$\left( \bigoplus_{i \in I} L_i \right) \otimes_R M \cong \bigoplus_{i \in I} (L_i \otimes_R M).$$

$\square$

## 4.5 Tensor-Hom Adjointness

**Lemma 4.2.** *Let  $B$  be an  $A$ -algebra, let  $M_1, M_2$  be  $B$ -modules, and let  $M_3$  be an  $A$ -module. Then we have an isomorphism of  $B$ -modules*

$$\text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3)) \cong \text{Hom}_A(M_1 \otimes_B M_2, M_3). \quad (26)$$

Moreover (??) is natural in  $M_1, M_2$ , and  $M_3$ .

*Proof.* We define

$$\Psi_{M_1, M_2, M_3}: \text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3)) \rightarrow \text{Hom}_A(M_1 \otimes_B M_2, M_3)$$

to be the map which sends a  $\psi \in \text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3))$  to the map  $\Psi(\psi) \in \text{Hom}_A(M_1 \otimes_B M_2, M_3)$  defined by

$$\Psi(\psi)(u_1 \otimes u_2) = (\psi(u_1))(u_2) \quad (27)$$

for all elementary tensors  $u_1 \otimes u_2 \in M_1 \otimes_B M_2$ . Note that  $\Psi(\psi)$  is a well-defined  $A$ -linear map since the map  $M_1 \times M_2 \rightarrow M_3$  given by

$$(u_1, u_2) \mapsto (\psi(u_1))(u_2)$$

is  $A$ -bilinear. Indeed, let  $a \in A$ . Then we have

$$\begin{aligned} (\psi(au_1))(u_2) &= (a\psi(u_1))(u_2) \\ &= (\psi(u_1))(au_2) \\ &= a((\psi(u_1))(u_2)) \end{aligned}$$

since both  $\psi$  and  $\psi(u_1)$  are  $A$ -linear. Similarly, if  $v_1 \in M_1$ , then

$$\begin{aligned} (\psi(u_1 + v_1))(u_2) &= (\psi(u_1) + \psi(v_1))(u_2) \\ &= (\psi(u_1))(u_2) + (\psi(v_1))(u_2), \end{aligned}$$

and if  $v_2 \in M_2$ , then

$$(\psi(u_1))(u_2 + v_2) = (\psi(u_1))(u_2) + (\psi(u_1))(v_2).$$

Thus  $\Psi(\psi)$  is a well-defined  $A$ -linear map.

Let us check that  $\Psi$  is  $B$ -linear. Let  $b, b' \in B$  and  $\psi, \psi' \in \text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3))$ . We want to show that

$$\Psi(b\psi + b'\psi') = b\Psi(\psi) + b'\Psi(\psi') \quad (28)$$

We will show (27) holds, by showing that the two maps agree on all elementary tensors in  $M_1 \otimes_B M_2$ . So  $u_1 \otimes u_2 \in M_1 \otimes_B M_2$ . Then

$$\begin{aligned} \Psi(b\psi + b'\psi')(u_1 \otimes u_2) &= ((b\psi + b'\psi')(u_1))(u_2) \\ &= ((b\psi)(u_1) + (b'\psi')(u_1))(u_2) \\ &= (\psi(bu_1) + \psi(b'u_1))(u_2) \\ &= (\psi(bu_1))(u_2) + (\psi(b'u_1))(u_2) \\ &= \Psi(\psi)(bu_1 \otimes u_2) + \Psi(\psi')(b'u_1 \otimes u_2) \\ &= (b\Psi(\psi))(u_1 \otimes u_2) + (b'\Psi(\psi'))(u_1 \otimes u_2). \\ &= (b\Psi(\psi) + b'\Psi(\psi'))(u_1 \otimes u_2) \end{aligned}$$

It follows that  $\Psi$  is  $B$ -linear.

To show that  $\Psi$  is an isomorphism of  $B$ -modules, we construct its inverse. We define

$$\Phi_{M_1, M_2, M_3}: \text{Hom}_A(M_1 \otimes_B M_2, M_3) \rightarrow \text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3))$$

to be the map given by

$$(\Phi(\varphi)(u_1))(u_2) = \varphi(u_1 \otimes u_2)$$

for all  $\varphi \in \text{Hom}_A(M_1 \otimes_B M_2, M_3)$ ,  $u_1 \in M_1$ , and  $u_2 \in M_2$ . We claim that  $\Psi$  and  $\Phi$  are inverse to each other. Indeed, we have

$$\begin{aligned} \Psi(\Phi(\varphi))(u_1 \otimes u_2) &= (\Phi(\varphi)(u_1))(u_2) \\ &= \varphi(u_1 \otimes u_2) \end{aligned}$$

for all  $\varphi \in \text{Hom}_A(M_1 \otimes_B M_2, M_3)$  and  $u_1 \otimes u_2 \in M_1 \otimes_B M_2$ . Thus  $\Psi\Phi = 1$ . Similarly, we have

$$\begin{aligned} (\Phi(\Psi(\psi))(u_1))(u_2) &= \Psi(\psi)(u_1 \otimes u_2) \\ &= (\psi(u_1))(u_2) \end{aligned}$$

for all  $\psi \in \text{Hom}_B(M_1, \text{Hom}_A(M_2, M_3))$  and  $u_1 \in M_1$  and  $u_2 \in M_2$ . Thus  $\Phi\Psi = 1$ .

Naturality in  $M_1$  means that if  $\lambda: M_1 \rightarrow M'_1$  is an  $R$ -module homomorphism, then we have a commutative diagram

$$\begin{array}{ccc} \text{Hom}_S(M'_1, \text{Hom}_R(M_2, M_3)) & \xrightarrow{\Psi_{M'_1, M_3}} & \text{Hom}_R(M'_1 \otimes_S M_2, M_3) \\ \lambda^* \downarrow & & \downarrow (\lambda \otimes 1)^* \\ \text{Hom}_S(M_1, \text{Hom}_R(M_2, M_3)) & \xrightarrow{\Psi_{M_1, M_3}} & \text{Hom}_R(M_1 \otimes_S M_2, M_3) \end{array}$$

Thus we want to show for all  $\psi \in \text{Hom}_S(M'_1, \text{Hom}_R(M_2, M_3))$ , we have

$$(\lambda \otimes 1)^* \left( \Psi_{M'_1, M_3}(\psi) \right) = \Psi_{M_1, M_3}(\lambda^*(\psi)) \quad (29)$$

To see that (28) is equal, we apply all elementary tensors to both sides. Let  $u_1 \otimes u_2 \in M_1 \otimes_S M_2$ . Then we have

$$\begin{aligned} \left( (\lambda \otimes 1)^* \left( \Psi_{M'_1, M_3}(\psi) \right) \right) (u_1 \otimes u_2) &= (\Psi_{M_1, M_3}(\psi))((\lambda \otimes 1)(u_1 \otimes u_2)) \\ &= (\Psi_{M_1, M_3}(\psi))(\lambda(u_1) \otimes u_2) \\ &= (\psi(\lambda(u_1)))(u_2) \\ &= ((\lambda^*(\psi))(u_1))(u_2) \\ &= (\Psi_{M_1, M_3}(\lambda^*(\psi)))(u_1 \otimes u_2) \\ &= (\Psi_{M_1, M_3}(\lambda^*(\psi)))(u_1 \otimes u_2). \end{aligned}$$

Similarly, naturality in  $M_3$  means that if  $\lambda: M_3 \rightarrow M'_3$  is an  $R$ -module homomorphism, then we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Hom}_S(M_1, \mathrm{Hom}_R(M_2, M_3)) & \xrightarrow{\Psi_{M_1, M_3}} & \mathrm{Hom}_R(M_1 \otimes_S M_2, M_3) \\ (\lambda_*)_* \downarrow & & \downarrow \lambda_* \\ \mathrm{Hom}_S(M_1, \mathrm{Hom}_R(M_2, M'_3)) & \xrightarrow{\Psi_{M_1, M'_3}} & \mathrm{Hom}_R(M_1 \otimes_S M_2, M'_3) \end{array}$$

Thus we want to show for all  $\psi \in \mathrm{Hom}_S(M_1, \mathrm{Hom}_R(M_2, M_3))$ , we have

$$\lambda_*(\Psi_{M_1, M_3}(\psi)) = \Psi_{M_1, M'_3}((\lambda_*)_*(\psi)) \quad (30)$$

To see that (29) is equal, we apply all elementary tensors to both sides. Let  $u_1 \otimes u_2 \in M_1 \otimes_S M_2$ . Then we have

$$\begin{aligned} (\lambda_*(\Psi_{M_1, M_3}(\psi)))(u_1 \otimes u_2) &= \lambda((\Psi_{M_1, M_3}(\psi))(u_1 \otimes u_2)) \\ &= \lambda((\psi(u_1))(u_2)) \\ &= (\lambda_*(\psi(u_1)))(u_2) \\ &= ((\lambda_*)_*(\psi))(u_1)(u_2) \\ &= (\Psi_{M_1, M'_3}((\lambda_*)_*(\psi)))(u_1 \otimes u_2). \end{aligned}$$

□

## 5 Localization

Throughout this section, all rings are assumed to be commutative. A notion of localization can still be defined for noncommutative rings, however we will not take this route.

### 5.1 Multiplicatively Closed Sets

**Definition 5.1.** Let  $R$  be a ring. A subset  $S \subset R$  is called **multiplicatively closed** if  $1 \in S$  and  $s, t \in S$  implies  $st \in S$ .

*Remark.* One can also say that a subset  $S \subset R$  is called multiplicatively closed if it is closed under products of elements, where the “empty product” is understood to be 1.

#### 5.1.1 Examples of multiplicatively closed sets

**Example 5.1.** Let  $\mathfrak{p} \subset R$  be a prime ideal. Then  $R \setminus \mathfrak{p}$  is a multiplicatively closed set.

**Example 5.2.** Let  $R$  be a ring and let  $a \in R$ . Then the set  $\{a^n \mid n \in \mathbb{Z}_{\geq 0}\}$  is a multiplicatively closed set.

**Example 5.3.** The set of all nonzero homogeneous polynomials in the polynomial ring  $R[x_1, \dots, x_n]$  is a multiplicatively closed set.

#### 5.1.2 Image of multiplicatively closed set is multiplicatively closed

**Proposition 5.1.** Let  $\varphi: A \rightarrow B$  be a ring homomorphism and let  $S$  be a multiplicatively closed subset of  $A$ . Then  $\varphi(S)$  is a multiplicatively closed subset of  $B$ .

*Proof.* Since  $\varphi$  is a ring homomorphism, it takes the identity to the identity, and so  $1 \in \varphi(S)$ . Also, if  $\varphi(s), \varphi(t) \in \varphi(S)$ , then

$$\begin{aligned} \varphi(s)\varphi(t) &= \varphi(st) \\ &\in \varphi(S). \end{aligned}$$

Thus  $\varphi(S)$  is multiplicatively closed. □

### 5.1.3 Inverse image of multiplicatively closed set is multiplicatively closed

**Proposition 5.2.** Let  $\varphi: A \rightarrow B$  be a ring homomorphism and let  $T$  be a multiplicatively closed subset of  $B$ . Then  $\varphi^{-1}(T)$  is a multiplicatively closed subset of  $A$ .

*Proof.* Since  $\varphi$  is a ring homomorphism, it takes the identity to the identity, and so  $1 \in \varphi^{-1}(T)$ . Also, if  $s, t \in \varphi^{-1}(T)$ , then  $\varphi(s), \varphi(t) \in T$ , and so

$$\begin{aligned}\varphi(st) &= \varphi(s)\varphi(t) \\ &\in T\end{aligned}$$

implies  $st \in \varphi^{-1}(T)$ . Thus  $\varphi^{-1}(T)$  is multiplicatively closed.  $\square$

## 5.2 Localization of ring with respect to multiplicatively closed set

**Definition 5.2.** We define the **localization of  $R$  with respect to  $S$** , denoted  $R_S$  or  $S^{-1}R$ , as follows: as a set  $R_S$  is given by

$$R_S := \left\{ \frac{a}{s} \mid a \in R, s \in S \right\}$$

where  $a/s$  denotes the equivalence class of  $(a, s) \in R \times S$  with respect to the following equivalence relation:

$$(a, s) \sim (a', s') \text{ if and only if there exists } s'' \in S \text{ such that } s''s'a = s''sa'. \quad (31)$$

We give  $R_S$  a ring structure by defining addition and multiplication on  $R_S$  by

$$\frac{a_1}{s_1} + \frac{a_2}{s_2} = \frac{s_2a_1 + s_1a_2}{s_1s_2} \quad \text{and} \quad \frac{a_1}{s_1} \cdot \frac{a_2}{s_2} = \frac{a_1a_2}{s_1s_2}, \quad (32)$$

for  $a_1/s_1$  and  $a_2/s_2$  in  $R_S$ , where  $1/1$  serves as the multiplicative identity element in  $R_S$  and  $0/0$  serves as the additive identity in  $R_S$ . The ring  $R_S$  comes equipped with a natural ring homomorphism  $\rho_S: R \rightarrow R_S$ , given by

$$\rho_S(a) = \frac{a}{1}$$

for all  $a \in R$ .

**Proposition 5.3.** With the notation as above,  $R_S$  is a ring. Furthermore,  $\rho_S: R \rightarrow R_S$  is a ring homomorphism.

*Proof.* There are several things we need to check. We will break this into steps

**Step 1:** We show that the relation (30) is in fact an equivalence relation. First we show reflexivity of  $\sim$ . Let  $(a, s) \in R \times S$ . Then since  $1 \in S$  and  $1 \cdot sa = 1 \cdot sa$ , we have  $(a, s) \sim (a, s)$ . Next we show symmetry of  $\sim$ . Suppose  $(a, s) \sim (a', s')$ . Choose  $s'' \in S$  such that  $s''s'a = s''sa'$ . Then by symmetry of equality, we have  $s''sa' = s''s'a$ . Therefore  $(a', s') \sim (a, s)$ . Finally, we show transitivity of  $\sim$ . Suppose  $(a_1, s_1) \sim (a_2, s_2)$  and  $(a_2, s_2) \sim (a_3, s_3)$ . Choose  $s_{12}, s_{23} \in S$  such that

$$s_{12}s_2a_1 = s_{12}s_1a_2 \quad \text{and} \quad s_{23}s_3a_2 = s_{23}s_2a_3$$

Then  $s_{23}s_{12}s_2 \in S$  and

$$\begin{aligned}(s_{23}s_{12}s_2)(s_3a_1) &= s_{23}(s_{12}s_2a_1)s_3 \\ &= s_{23}(s_{12}s_1a_2)s_3 \\ &= s_{12}s_1(s_{23}s_3a_2) \\ &= s_{12}s_1(s_{23}s_2a_3) \\ &= (s_{12}s_{23}s_2)(s_1a_3).\end{aligned}$$

Thus  $\sim$  is in fact an equivalence relation.

**Step 2:** Addition and multiplication defined in (31) are well-defined. Suppose  $a_1/s_1 = a'_1/s'_1$  and  $a_2/s_2 = a'_2/s'_2$ . Choose  $s''_1, s''_2 \in S$  such that

$$s''_1s'_1a_1 = s''_1s_1a'_1 \quad \text{and} \quad s''_2s'_2a_2 = s''_2s_2a'_2.$$

Then  $s''_1s''_2 \in S$  and

$$\begin{aligned}s''_1s''_2(s_2a_1 + s_1a_2)s'_1s'_2 &= s''_2s_2(s''_1s'_1a_1)s'_2 + s''_1s_1(s''_2s'_2a_2)s'_1 \\ &= s''_2s_2(s''_1s_1a'_1)s'_2 + s''_1s_1(s''_2s_2a'_2)s'_1 \\ &= s''_2s_2(s''_1s_1a'_1)s'_2 + s''_1s_1(s''_2s_2a'_2)s'_1 \\ &= s''_1s''_2(s'_2a'_1 + s'_1a'_2)s_1s_2\end{aligned}$$

implies

$$\frac{s_2 a_1 + s_1 a_2}{s_1 s_2} = \frac{s'_2 a'_1 + s'_1 a'_2}{s'_1 s'_2}.$$

Similarly,  $s''_1 s''_2$  and

$$\begin{aligned} s''_1 s''_2 a_1 a_2 s'_1 s'_2 &= (s''_1 s'_1 a_1)(s''_2 s'_2 a_2) \\ &= (s''_1 s_1 a'_1)(s''_2 s_2 a'_2) \\ &= s''_1 s''_2 a'_1 a'_2 s_1 s_2 \end{aligned}$$

implies

$$\frac{a_1 a_2}{s_1 s_2} = \frac{a'_1 a'_2}{s'_1 s'_2}.$$

Thus we have shown that addition and multiplication in (31) are well-defined.

**Step 3:** Now we check that addition and multiplication in (31) gives us a ring structure. First let us show that addition in (31) gives us an abelian group with  $0/1$  being the additive identity. We begin by checking associativity. Let  $a_1/s_1, a_2/s_2, a_3/s_3 \in R_S$ . Then

$$\begin{aligned} \left( \frac{a_1}{s_1} + \frac{a_2}{s_2} \right) + \frac{a_3}{s_3} &= \frac{s_2 a_1 + s_1 a_2}{s_1 s_2} + \frac{a_3}{s_3} \\ &= \frac{s_3(s_2 a_1 + s_1 a_2) + (s_1 s_2) a_3}{(s_1 s_2) s_3} \\ &= \frac{s_3(s_2 a_1) + s_3(s_1 a_2) + (s_1 s_2) a_3}{s_1(s_2 s_3)} \\ &= \frac{(s_2 s_3) a_1 + s_1(s_3 a_2) + s_1(s_2 a_3)}{s_1(s_2 s_3)} \\ &= \frac{(s_2 s_3) a_1 + s_1(s_3 a_2 + s_2 a_3)}{s_1(s_2 s_3)} \\ &= \frac{a_1}{s_1} + \frac{s_3 a_2 + s_2 a_3}{s_2 s_3} \\ &= \frac{a_1}{s_1} + \left( \frac{a_2}{s_2} + \frac{a_3}{s_3} \right). \end{aligned}$$

Thus addition in (31) is associative. Now we check commutativity. Let  $a_1/s_1, a_2/s_2 \in R_S$ . Then

$$\begin{aligned} \frac{a_1}{s_1} + \frac{a_2}{s_2} &= \frac{s_2 a_1 + s_1 a_2}{s_1 s_2} \\ &= \frac{s_1 a_2 + s_2 a_1}{s_2 s_1} \\ &= \frac{a_2}{s_2} + \frac{a_1}{s_1}. \end{aligned}$$

Thus addition in (31) is commutative. Now we check that  $0/1$  is the identity. Let  $a/s \in R_S$ . Then

$$\begin{aligned} \frac{0}{1} + \frac{a}{s} &= \frac{s \cdot 0 + 1 \cdot a}{1 \cdot s} \\ &= \frac{0 + a}{s} \\ &= \frac{a}{s}. \end{aligned}$$

Thus addition in (31) is commutative. Thus  $0/1$  is the identity. Finally we check that every element has an inverse. Let  $a/s \in R_S$ . Then

$$\begin{aligned} \frac{a}{s} + \frac{-a}{s} &= \frac{a - a}{s} \\ &= \frac{0}{s} \\ &= \frac{0}{1}. \end{aligned}$$

implies  $-a/s$  is the inverse to  $a/s$ . Therefore  $(R_S, +)$  forms an abelian group with  $0/1$  being identity element.

Now let us show that  $(R_S, +, \cdot)$  is a ring. We first check that multiplication in (31) is associative. Let  $a_1/s_1, a_2/s_2, a_3/s_3 \in R_S$ . Then

$$\begin{aligned} \left( \frac{a_1}{s_1} \frac{a_2}{s_2} \right) \frac{a_3}{s_3} &= \frac{a_1 a_2}{s_1 s_2} \frac{a_3}{s_3} \\ &= \frac{(a_1 a_2) a_3}{(s_1 s_2) s_3} \\ &= \frac{a_1 (a_2 a_3)}{s_1 (s_2 s_3)} \\ &= \frac{a_1}{s_1} \frac{a_2 a_3}{s_2 s_3} \\ &= \frac{a_1}{s_1} \left( \frac{a_2}{s_2} \frac{a_3}{s_3} \right). \end{aligned}$$

Therefore multiplication in (31) is associative. Next we check that multiplication in (31) distributes over addition.

Let  $a_1/s_1, a_2/s_2, a_3/s_3 \in R_S$ . Then

$$\begin{aligned} \frac{a_1}{s_1} \left( \frac{a_2}{s_2} + \frac{a_3}{s_3} \right) &= \frac{a_1}{s_1} \left( \frac{s_3 a_2 + s_2 a_3}{s_2 s_3} \right) \\ &= \frac{a_1 (s_3 a_2 + s_2 a_3)}{s_1 s_2 s_3} \\ &= \frac{a_1 s_3 a_2 + a_1 s_2 a_3}{s_1 s_2 s_3} \\ &= \frac{s_3 a_1 a_2 + s_2 a_1 a_3}{s_1 s_2 s_3} \\ &= \frac{s_3 a_1 a_2}{s_1 s_2 s_3} + \frac{s_2 a_1 a_3}{s_1 s_2 s_3} \\ &= \frac{a_1 a_2}{s_1 s_2} + \frac{a_1 a_3}{s_1 s_3} \\ &= \frac{a_1}{s_1} \frac{a_2}{s_2} + \frac{a_1}{s_1} \frac{a_3}{s_3} \end{aligned}$$

Thus multiplication in (31) distributes over addition. Finally, let us check that  $1/1$  is the identity element in  $R_S$  under multiplication. Let  $a/s \in R_S$ . Then

$$\begin{aligned} \frac{1}{1} \cdot \frac{a}{s} &= \frac{1 \cdot a}{1 \cdot s} \\ &= \frac{a}{s}. \end{aligned}$$

Thus  $1/1$  is the identity element in  $R_S$  under multiplication.

**Step 4:** For the final step, we prove that  $\rho_S: R \rightarrow R_S$  is a ring homomorphism. First note that it sends the identity to the identity. Next, let  $a, b \in R$ . Then

$$\begin{aligned} \rho_S(a + b) &= \frac{a + b}{1} \\ &= \frac{1 \cdot a + 1 \cdot b}{1 \cdot 1} \\ &= \frac{a}{1} + \frac{b}{1} \\ &= \rho_S(a) + \rho_S(b) \end{aligned}$$

and

$$\begin{aligned} \rho_S(ab) &= \frac{ab}{1} \\ &= \frac{ab}{1 \cdot 1} \\ &= \frac{a}{1} \cdot \frac{b}{1} \\ &= \rho_S(a) \rho_S(b). \end{aligned}$$

Thus  $\rho_S$  is a ring homomorphism. □

### 5.2.1 Universal Mapping Property of Localization

**Proposition 5.4.** *Let  $S$  be a multiplicatively closed subset of a ring  $A$  and let  $\varphi: A \rightarrow B$  be a ring homomorphism such that  $\varphi(S) \subseteq B^\times$ . Then there exists a unique ring homomorphism  $\tilde{\varphi}: A_S \rightarrow B$  such that  $\tilde{\varphi}\rho_S = \varphi$ .*

*Proof.* We define  $\tilde{\varphi}: A_S \rightarrow B$  by

$$\tilde{\varphi}\left(\frac{a}{s}\right) = \varphi(a)\varphi(s)^{-1} \quad (33)$$

for all  $a/s \in A_S$ . We need to verify that (32) is well-defined. Suppose  $a'/s' = a/s$ . Choose  $s'' \in S$  such that  $s''sa' = s''s'a$ . Then  $\varphi(a') = \varphi(s'')\varphi(s')\varphi(s'')^{-1}\varphi(s)^{-1}\varphi(a)$  in  $B$ , and so

$$\begin{aligned} \tilde{\varphi}\left(\frac{a'}{s'}\right) &= \varphi(a')\varphi(s')^{-1} \\ &= \varphi(s'')\varphi(s')\varphi(s'')^{-1}\varphi(s)^{-1}\varphi(a)\varphi(s')^{-1} \\ &= \varphi(a)\varphi(s)^{-1} \\ &= \tilde{\varphi}\left(\frac{a}{s}\right). \end{aligned}$$

Thus (32) is well-defined. It is also easily seen to be a ring homomorphism which satisfies

$$\begin{aligned} (\tilde{\varphi}\rho_S)(a) &= \tilde{\varphi}(\rho_S(a)) \\ &= \tilde{\varphi}\left(\frac{a}{1}\right) \\ &= \frac{\varphi(a)}{\varphi(1)} \\ &= \frac{\varphi(a)}{1} \\ &= \varphi(a). \end{aligned}$$

for all  $a \in A$ . Thus  $\tilde{\varphi}\rho_S = \varphi$ . This shows existence.

For uniqueness, suppose  $\tilde{\varphi}$  and  $\tilde{\varphi}'$  are two such maps. Then we have

$$\begin{aligned} \tilde{\varphi}\left(\frac{a}{s}\right) &= \tilde{\varphi}\left(\frac{1}{s} \cdot \frac{a}{1}\right) \\ &= \tilde{\varphi}\left(\frac{1}{s}\right)\tilde{\varphi}\left(\frac{a}{1}\right) \\ &= \left(\tilde{\varphi}\left(\frac{s}{1}\right)\right)^{-1}\tilde{\varphi}\left(\frac{a}{1}\right) \\ &= \left(\tilde{\varphi}'\left(\frac{s}{1}\right)\right)^{-1}\tilde{\varphi}'\left(\frac{a}{1}\right) \\ &= \tilde{\varphi}'\left(\frac{1}{s}\right)\tilde{\varphi}'\left(\frac{a}{1}\right) \\ &= \tilde{\varphi}'\left(\frac{1}{s} \cdot \frac{a}{1}\right) \\ &= \tilde{\varphi}'\left(\frac{a}{s}\right) \end{aligned}$$

for all  $a/s \in A_S$ . Thus  $\tilde{\varphi} = \tilde{\varphi}'$ . □

### 5.2.2 Properties of $\rho_S$

**Proposition 5.5.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then*

1.  $\rho_S$  is injective if and only if  $S$  does not contain any zero divisors;
2.  $\rho_S$  is an isomorphism if and only if  $S$  consists of units.

*Proof.* 1. Suppose  $\rho_S$  is injective and assume for a contradiction that  $S$  contains a zero divisor, say  $s \in S$  with  $st = 0$  for some  $t \in R \setminus \{0\}$ . Then observe that  $t \neq 0$  but  $t/1 = 0$  since  $st = 0$  where  $s \in S$ . This contradicts the fact that  $\rho_S$  is injective.

Conversely, suppose  $S$  does not contain any zero divisors and assume for a contradiction that  $\rho_S$  is not injective. Choose  $t \in R \setminus \{0\}$  such that  $1/t = 0$ . Then there exists an  $s \in S$  such that  $st = 0$ . This implies  $s$  is a zero divisor, which contradicts the fact that  $S$  does not contain any zero divisors.

2. By the universal mapping property of localization applied to the identity map  $1_R: R \rightarrow R$ , there exists a ring homomorphism  $\psi: R_S \rightarrow R$  such that  $\psi\rho_S = 1_R$ . Applying the universal mapping property of localization to the map  $\rho_S: R \rightarrow R_S$ , we see that  $1_{R_S}: R_S \rightarrow R_S$  is the *unique* homomorphism which satisfies  $1_{R_S}\rho_S = \rho_S$ , but observe that we also have

$$\begin{aligned} (\rho_S\psi)\rho_S &= \rho_S(\psi\rho_S) \\ &= \rho_S 1_R \\ &= \rho_S. \end{aligned}$$

Thus by uniqueness, we have  $1_{R_S} = \rho_S\psi$ . It follows that  $\rho_S$  is an isomorphism with  $\psi$  being its inverse.  $\square$

### 5.2.3 Prime Ideals in $R_S$

Recall that we denote by  $\text{Spec } R$  to be the set of all prime ideals in  $R$ . If  $S$  is a multiplicatively closed subset of  $R$ , then we can give a simple description of  $\text{Spec } R_S$  in terms of a subset of  $\text{Spec } R$ .

**Theorem 5.1.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then we have a bijection*

$$\Psi: \{\mathfrak{p} \in \text{Spec } R \mid \mathfrak{p} \cap S = \emptyset\} \rightarrow \text{Spec } R_S$$

*given by  $\Psi(\mathfrak{p}) = \mathfrak{p}_S$  for all prime ideals  $\mathfrak{p}$  in  $R$  such that  $\mathfrak{p} \cap S = \emptyset$ . Then inverse to  $\Psi$ , which we denote by*

$$\Phi: \text{Spec } R_S \rightarrow \{\mathfrak{p} \in \text{Spec } R \mid \mathfrak{p} \cap S = \emptyset\}$$

*is given by  $\Phi(\mathfrak{q}) = \rho^{-1}(\mathfrak{q})$  for all prime ideals  $\mathfrak{q}$  in  $R_S$  where  $\rho: R \rightarrow R_S$  is the canonical localization map.*

*Proof.* First note that both  $\Psi$  and  $\Phi$  land in their designated target spaces. Indeed, for any prime ideal  $\mathfrak{q}$  in  $\text{Spec } R_S$ , the ideal  $\rho^{-1}(\mathfrak{q})$  is easily seen to be prime in  $R$ . Also if  $\mathfrak{p}$  is a prime ideal in  $R$  such that  $\mathfrak{p} \cap S = \emptyset$ , then  $\mathfrak{p}_S$  is a prime ideal in  $R_S$ . Indeed, let  $x/s, y/t \in \mathfrak{p}_S$ , where  $x, y \in \mathfrak{p}$  and  $s, t \in S$ , and suppose  $(x/s)(y/t) \in \mathfrak{p}_S$ . Then  $xy/st \in \mathfrak{p}_S$ , which implies  $xy \in \mathfrak{p}$ . Since  $\mathfrak{p}$  is prime, we have either  $x \in \mathfrak{p}$  or  $y \in \mathfrak{p}$ . Without loss of generality, say  $x \in \mathfrak{p}$ . Then clearly  $x/s \in \mathfrak{p}_S$ . This implies  $\mathfrak{p}_S$  is prime.

We now want to show that these two maps are inverse to each other. First let us show that  $\Psi$  is injective. Let  $\mathfrak{p}$  and  $\mathfrak{p}'$  be two distinct primes in  $R$  such that  $\mathfrak{p} \cap S = \mathfrak{p}' \cap S = \emptyset$ . Without loss of generality, say  $\mathfrak{p} \not\subseteq \mathfrak{p}'$ . Choose  $x \in \mathfrak{p} \setminus \mathfrak{p}'$ . Then observe that  $x/1 \in \mathfrak{p}_S$ . Furthermore, we also have  $x/1 \notin \mathfrak{p}'_S$ . Indeed, assume for a contradiction  $x/1 \in \mathfrak{p}'_S$ . Then  $x/1 = y/s$  with  $y \in \mathfrak{p}'$  and  $s \in S$ . Then there exists  $t \in S$  such that  $tsx = ty \in \mathfrak{p}'$ . As  $\mathfrak{p}'$  is prime and  $s, t \notin \mathfrak{p}'$ , we must have  $x \in \mathfrak{p}'$ , which is a contradiction. This shows that  $\mathfrak{p}_S$  and  $\mathfrak{p}'_S$  are distinct, and hence  $\Psi$  is injective.

Now we will show  $\Psi$  is surjective. Let  $\mathfrak{q} \in \text{Spec } R_S$ . We claim that  $\mathfrak{q} = \rho^{-1}(\mathfrak{q})_S$ . Indeed, we have

$$\begin{aligned} \rho^{-1}(\mathfrak{q})_S &= \{x/s \mid x \in \rho^{-1}(\mathfrak{q}) \text{ and } s \in S\} \\ &= \{x/s \mid x/1 \in \mathfrak{q} \text{ and } s \in S\} \\ &= \mathfrak{q}, \end{aligned}$$

where equality in the last line follows from the fact that  $\mathfrak{q}$  is prime: if  $x/s \in \mathfrak{q}$ , then  $x/1 \in \mathfrak{q}$  since  $1/s \notin \mathfrak{q}$  and  $x/s = (x/1)(1/s)$ . Thus  $\Psi$  is surjective and hence a bijection. In proving that  $\Psi$  is surjective, we also see that the inverse of  $\Psi$  is  $\Phi$ .  $\square$

## 5.3 Localization of module with respect to multiplicatively closed set

**Definition 5.3.** Let  $S$  be a multiplicatively closed subset of  $R$  and let  $M$  be an  $R$ -module. We define the **localization of  $M$  with respect to  $S$** , denoted  $M_S$  or  $S^{-1}M$ , as follows: as a set  $M_S$  is given by

$$M_S := \left\{ \frac{u}{s} \mid u \in M, s \in S \right\}$$

where  $u/s$  denotes the equivalence class of  $(u, s) \in M \times S$  with respect to the following equivalence relation:

$$(u, s) \sim (u', s') \text{ if and only if there exists } s'' \in S \text{ such that } s''s'u = s''s'u'. \quad (34)$$

We give  $M_S$  an  $R_S$ -module structure by ring defining addition and scalar multiplication on  $M_S$  by

$$\frac{u_1}{s_1} + \frac{u_2}{s_2} = \frac{s_2u_1 + s_1u_2}{s_1s_2} \quad \text{and} \quad \frac{a}{s} \frac{u}{t} = \frac{au}{st}, \quad (35)$$

for  $u_1/s_1, u_2/s_2, u/t \in M_S$  and  $a/s \in R_S$ , with  $0/0$  being the additive identity in  $M_S$ .

**Proposition 5.6.** *With the notation above,  $M_S$  is an  $R_S$ -module. By restricting scalars via the ring homomorphism  $\rho_S: R \rightarrow R_S$ , it is also an  $R$ -module. More specifically, the  $R$ -module scalar multiplication is given by*

$$a \cdot \frac{u}{s} = \frac{au}{s}$$

for all  $a \in R$  and  $u/s \in M_S$ .

*Proof.* The proof of this is similar to the proof of (5.3), but we include it here for completeness. Again, there are several things we need to check, so we break it up into steps.

**Step 1:** We show that the relation (30) is in fact an equivalence relation. First we show reflexivity of  $\sim$ . Let  $(u, s) \in M \times S$ . Then since  $1 \in S$  and  $1 \cdot su = 1 \cdot su$ , we have  $(u, s) \sim (u, s)$ . Next we show symmetry of  $\sim$ . Suppose  $(u, s) \sim (u', s')$ . Choose  $s'' \in S$  such that  $s''s'u = s''su'$ . Then by symmetry of equality, we have  $s''su' = s''s'u$ . Therefore  $(u', s') \sim (u, s)$ . Finally, we show transitivity of  $\sim$ . Suppose  $(u_1, s_1) \sim (u_2, s_2)$  and  $(u_2, s_2) \sim (u_3, s_3)$ . Choose  $s_{12}, s_{23} \in S$  such that

$$s_{12}s_2u_1 = s_{12}s_1u_2 \quad \text{and} \quad s_{23}s_3u_2 = s_{23}s_2u_3$$

Then  $s_{23}s_{12}s_2 \in S$  and

$$\begin{aligned} (s_{23}s_{12}s_2)(s_3u_1) &= s_{23}(s_{12}s_2u_1)s_3 \\ &= s_{23}(s_{12}s_1u_2)s_3 \\ &= s_{12}s_1(s_{23}s_3u_2) \\ &= s_{12}s_1(s_{23}s_2u_3) \\ &= (s_{12}s_{23}s_2)(s_1u_3). \end{aligned}$$

Thus  $\sim$  is in fact an equivalence relation.

**Step 2:** Addition and multiplication in (34) are well-defined. Suppose  $u_1/s_1 = u'_1/s'_1$  and  $u_2/s_2 = u'_2/s'_2$ . Choose  $s''_1, s''_2 \in S$  such that

$$s''_1s'_1u_1 = s''_1s_1u'_1 \quad \text{and} \quad s''_2s'_2u_2 = s''_2s_2u'_2.$$

Then  $s''_1s''_2 \in S$  and

$$\begin{aligned} s''_1s''_2(s_2u_1 + s_1u_2)s'_1s'_2 &= s''_2s_2(s''_1s'_1u_1)s'_2 + s''_1s_1(s''_2s'_2u_2)s'_1 \\ &= s''_2s_2(s''_1s_1u'_1)s'_2 + s''_1s_1(s''_2s_2u'_2)s'_1 \\ &= s''_2s_2(s''_1s_1u'_1)s'_2 + s''_1s_1(s''_2s_2u'_2)s'_1 \\ &= s''_1s''_2(s'_2u'_1 + s'_1u'_2)s_1s_2 \end{aligned}$$

implies

$$\frac{s_2u_1 + s_1u_2}{s_1s_2} = \frac{s'_2u'_1 + s'_1u'_2}{s'_1s'_2}.$$

Similarly,  $s''_1s''_2 \in S$  and

$$\begin{aligned} s''_1s''_2u_1u_2s'_1s'_2 &= (s''_1s'_1u_1)(s''_2s'_2u_2) \\ &= (s''_1s_1u'_1)(s''_2s_2u'_2) \\ &= s''_1s''_2u'_1u'_2s_1s_2 \end{aligned}$$

implies

$$\frac{a_1a_2}{s_1s_2} = \frac{a'_1a'_2}{s'_1s'_2}.$$

Thus we have shown that addition and scalar multiplication in (34) are well-defined.

**Step 3:** Now we show that addition and multiplication in (34) gives us an  $R_S$ -module structure. First let us show that addition in (34) gives us an abelian group with  $0/1$  being the additive identity. We begin by checking

associativity. Let  $u_1/s_1, u_2/s_2, u_3/s_3 \in M_S$ . Then

$$\begin{aligned}
 \left(\frac{u_1}{s_1} + \frac{u_2}{s_2}\right) + \frac{u_3}{s_3} &= \frac{s_2u_1 + s_1u_2}{s_1s_2} + \frac{u_3}{s_3} \\
 &= \frac{s_3(s_2u_1 + s_1u_2) + (s_1s_2)u_3}{(s_1s_2)s_3} \\
 &= \frac{s_3(s_2u_1) + s_3(s_1u_2) + (s_1s_2)u_3}{s_1(s_2s_3)} \\
 &= \frac{(s_2s_3)u_1 + s_1(s_3u_2) + s_1(s_2u_3)}{s_1(s_2s_3)} \\
 &= \frac{(s_2s_3)u_1 + s_1(s_3u_2 + s_2u_3)}{s_1(s_2s_3)} \\
 &= \frac{u_1}{s_1} + \frac{s_3u_2 + s_2u_3}{s_2s_3} \\
 &= \frac{u_1}{s_1} + \left(\frac{u_2}{s_2} + \frac{u_3}{s_3}\right).
 \end{aligned}$$

Thus addition in (34) is associative. Now we check commutativity. Let  $u_1/s_1, u_2/s_2 \in M_S$ . Then

$$\begin{aligned}
 \frac{u_1}{s_1} + \frac{u_2}{s_2} &= \frac{s_2u_1 + s_1u_2}{s_1s_2} \\
 &= \frac{s_1u_2 + s_2u_1}{s_2s_1} \\
 &= \frac{u_2}{s_2} + \frac{u_1}{s_1}.
 \end{aligned}$$

Thus addition in (34) is commutative. Now we check that  $0/1$  is the identity. Let  $u/s \in M_S$ . Then

$$\begin{aligned}
 \frac{0}{1} + \frac{u}{s} &= \frac{s \cdot 0 + 1 \cdot u}{1 \cdot s} \\
 &= \frac{0 + u}{s} \\
 &= \frac{u}{s}.
 \end{aligned}$$

Thus  $0/1$  is the identity. Finally we check that every element has an inverse. Let  $u/s \in M_S$ . Then

$$\begin{aligned}
 \frac{u}{s} + \frac{-u}{s} &= \frac{u - u}{s} \\
 &= \frac{0}{s} \\
 &= \frac{0}{1}.
 \end{aligned}$$

implies  $-u/s$  is the inverse to  $u/s$ . Therefore  $(M_S, +)$  forms an abelian group with  $0/1$  being the identity element.

Now let us show that  $(M_S, +, \cdot)$  is an  $R_S$ -module. We first check that scalar multiplication in (34) is associative. Let  $a_1/s_1, a_2/s_2 \in R_S$  and let  $u/s \in M_S$ . Then

$$\begin{aligned}
 \left(\frac{a_1}{s_1} \frac{a_2}{s_2}\right) \frac{u}{s} &= \frac{a_1a_2}{s_1s_2} \frac{u}{s} \\
 &= \frac{(a_1a_2)u}{(s_1s_2)s} \\
 &= \frac{a_1(a_2u)}{s_1(s_2s)} \\
 &= \frac{a_1}{s_1} \frac{a_2u}{s_2s} \\
 &= \frac{a_1}{s_1} \left(\frac{a_2}{s_2} \frac{u}{s}\right).
 \end{aligned}$$

Therefore scalar multiplication in (34) is associative. Next we check that scalar multiplication in (34) distributes over addition. Let  $a/s \in R_S$  and  $u_1/s_1, u_2/s_2 \in M_S$ . Then

$$\begin{aligned} \frac{a}{s} \left( \frac{u_1}{s_1} + \frac{u_2}{s_2} \right) &= \frac{a}{s} \left( \frac{s_2 u_1 + s_1 u_2}{s_1 s_2} \right) \\ &= \frac{a(s_2 u_1 + s_1 u_2)}{s s_1 s_2} \\ &= \frac{a s_2 u_1 + a s_1 u_2}{s s_1 s_2} \\ &= \frac{s_2 a u_1 + s a u_2}{s s_1 s_2} \\ &= \frac{s_2 a u_1}{s s_1 s_2} + \frac{s a u_2}{s s_1 s_2} \\ &= \frac{a u_1}{s s_1} + \frac{a u_2}{s s_2} \\ &= \frac{a}{s} \frac{u_1}{s_1} + \frac{a}{s} \frac{u_2}{s_2}. \end{aligned}$$

Similarly, let  $a_1/s_1, a_2/s_2 \in R_S$  and  $u/s \in M_S$ . Then

$$\begin{aligned} \left( \frac{a_1}{s_1} + \frac{a_2}{s_2} \right) \frac{u}{s} &= \left( \frac{s_2 a_1 + s_1 a_2}{s_1 s_2} \right) \frac{u}{s} \\ &= \frac{(s_2 a_1 + s_1 a_2) u}{s_1 s_2 s} \\ &= \frac{s_2 a_1 u + s_1 a_2 u}{s_1 s_2 s} \\ &= \frac{s_2 a_1 u}{s_2 s_1 s} + \frac{s_1 a_2 u}{s_1 s_2 s} \\ &= \frac{a_1 u}{s_1 s} + \frac{a_2 u}{s_2 s} \\ &= \frac{a_1}{s_1} \frac{u}{s} + \frac{a_2}{s_2} \frac{u}{s}. \end{aligned}$$

Thus multiplication in (34) distributes over addition. Finally, let us check that  $1/1$  fixes  $M_S$ . Let  $u/s \in M_S$ . Then

$$\begin{aligned} \frac{1}{1} \cdot \frac{u}{s} &= \frac{1 \cdot u}{1 \cdot s} \\ &= \frac{u}{s}. \end{aligned}$$

Thus  $1/1$  fixes  $M_S$ . □

## 5.4 Localization as a functor

**Proposition 5.7.** *Let  $S$  be a multiplicatively closed subset of  $R$ . We obtained a functor*

$$-_S: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_{R_S}$$

*called **localization** where an  $R$ -module  $M$  is mapped to the  $R_S$ -module  $M_S$  and where the  $R$ -linear map  $\varphi: M \rightarrow N$  is mapped to the  $R_S$ -linear map  $\varphi_S: M_S \rightarrow N_S$  given by*

$$\varphi_S \left( \frac{u}{s} \right) = \frac{\varphi(u)}{s} \tag{36}$$

*for all  $u/s \in M_S$ .*

*Proof.* We first check that (35) is well-defined. Suppose  $u/s = u'/s'$ . Choose  $s'' \in S$  such that  $s''s'u = s''su'$ . Then  $s''s'\varphi(u) = s''s'\varphi(u')$  by  $R$ -linearity of  $\varphi$ , and hence  $\varphi(u)/s = \varphi(u')/s'$ . Thus (35) is well-defined.

Now let us check that  $\varphi_S$  is an  $R_S$ -linear map. Let  $a_1/s_1, a_2/s_2 \in R_S$  and let  $u_1/t_1, u_2/t_2 \in M_S$ . Then

$$\begin{aligned} \varphi_S \left( \frac{a_1}{s_1} \frac{u_1}{t_1} + \frac{a_2}{s_2} \frac{u_2}{t_2} \right) &= \varphi_S \left( \frac{s_2 t_2 a_1 u_1 + s_1 t_1 a_2 u_2}{s_1 t_1 s_2 t_2} \right) \\ &= \frac{\varphi(s_2 t_2 a_1 u_1 + s_1 t_1 a_2 u_2)}{s_1 t_1 s_2 t_2} \\ &= \frac{s_2 t_2 a_1 \varphi(u_1) + s_1 t_1 a_2 \varphi(u_2)}{s_1 t_1 s_2 t_2} \\ &= \frac{a_1}{s_1} \frac{\varphi(u_1)}{t_1} + \frac{a_2}{s_2} \frac{\varphi(u_2)}{t_2} \\ &= \frac{a_1}{s_1} \varphi_S \left( \frac{u_1}{t_1} \right) + \frac{a_2}{s_2} \varphi_S \left( \frac{u_2}{t_2} \right). \end{aligned}$$

Thus  $\varphi_S$  is an  $R_S$ -linear map.

Now to see that  $-_S$  is a functor, we need to check that it preserves identities and compositions. First we show it preserves identities. Let  $M$  be an  $R$ -module. Then

$$\begin{aligned} (1_M)_S \left( \frac{u}{s} \right) &= \frac{1_M(u)}{s} \\ &= \frac{u}{s} \\ &= 1_{M_S} \left( \frac{u}{s} \right) \end{aligned}$$

for all  $u/s \in M_S$ . Thus  $(1_M)_S = 1_{M_S}$ , and hence  $-_S$  preserves identities. Next we show it preserves compositions. Let  $\varphi: M \rightarrow M'$  and  $\varphi': M' \rightarrow M''$  be two  $R$ -linear maps. Then

$$\begin{aligned} (\varphi' \varphi)_S \left( \frac{u}{s} \right) &= \frac{(\varphi' \varphi)(u)}{s} \\ &= \frac{\varphi'(\varphi(u))}{s} \\ &= \varphi'_S \left( \frac{\varphi(u)}{s} \right) \\ &= \varphi'_S \left( \varphi_S \left( \frac{u}{s} \right) \right) \\ &= (\varphi'_S \varphi_S) \left( \frac{u}{s} \right) \end{aligned}$$

for all  $u/s \in M_S$ . Thus  $(\varphi' \varphi)_S = \varphi'_S \varphi_S$ , and hence  $-_S$  preserves compositions.  $\square$

#### 5.4.1 Natural isomorphism between functors $R_S \otimes_R -$ and $-_S$

**Lemma 5.2.** *Let  $N$  be an  $R$ -module. Every element in  $R_S \otimes_R N$  can be expressed as an elementary tensor of the form  $(1/s) \otimes v$  with  $s \in S$  and  $v \in N$ .*

*Proof.* Let  $\sum_{i=1}^n (a_i/s_i) \otimes v_i$  be a general tensor in  $R_S \otimes_R N$ . Then

$$\begin{aligned} \frac{a_1}{s_1} \otimes v_1 + \cdots + \frac{a_n}{s_n} \otimes v_n &= \frac{a_1 s_2 \cdots s_n}{s_1 s_2 \cdots s_n} \otimes v_1 + \cdots + \frac{s_1 s_2 \cdots a_n}{s_1 s_2 \cdots s_n} \otimes v_n \\ &= \frac{1}{s_1 s_2 \cdots s_n} \otimes a_1 s_2 \cdots s_n v_1 + \cdots + \frac{1}{s_1 s_2 \cdots s_n} \otimes s_1 s_2 \cdots a_n v_n \\ &= \frac{1}{s_1 s_2 \cdots s_n} \otimes (a_1 s_2 \cdots s_n v_1 + \cdots + s_1 s_2 \cdots a_n v_n) \\ &= \frac{1}{s} \otimes v, \end{aligned}$$

where  $s = s_1 s_2 \cdots s_n$  and  $v = a_1 s_2 \cdots s_n v_1 + \cdots + s_1 s_2 \cdots a_n v_n$ .  $\square$

**Proposition 5.8.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then we have a natural isomorphism between functors*

$$R_S \otimes_R -: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_{R_S} \quad \text{and} \quad -_S: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_{R_S}$$

*Proof.* For each  $R$ -module  $M$ , we define  $\eta_M: R_S \otimes_R M \rightarrow M_S$  by

$$\eta_M \left( \frac{1}{s} \otimes u \right) = \frac{u}{s}$$

for all  $(1/s) \otimes u \in R_S \otimes_R M$ . By Lemma (5.2), every tensor in  $R_S \otimes_R M$  can be expressed as an elementary tensor of the form  $(1/s) \otimes u$ , and so  $\eta_M$  really is defined on all of  $R_S \otimes_R M$ . Also  $\eta_M$  is a well-defined  $R$ -linear map since the map  $R_S \times M \rightarrow M_S$  given by

$$\left( \frac{1}{s}, u \right) \mapsto \frac{u}{s}$$

is readily seen to be  $R$ -bilinear. The map  $\eta_M$  is surjective since every element in  $M_S$  can be expressed in the form  $u/s$ . Let us show that  $\eta_M$  is injective. Suppose  $(1/s) \otimes u \in \ker \eta_M$ . Then  $u/s = 0/1$ . Then exists a  $t \in S$  such that

$$\begin{aligned} tu &= t \cdot 1 \cdot u \\ &= t \cdot s \cdot 0 \\ &= 0. \end{aligned}$$

This implies

$$\begin{aligned} \frac{1}{s} \otimes u &= \frac{t}{st} \otimes u \\ &= \frac{1}{st} \otimes tu \\ &= \frac{1}{st} \otimes 0 \\ &= 0. \end{aligned}$$

Thus  $\eta_M$  is injective, and hence an isomorphism.

Now we will show that  $\eta$  is a natural transformation. Let  $\varphi: M \rightarrow N$  be an  $R$ -linear map. We need to show that the diagram below commutes

$$\begin{array}{ccc} R_S \otimes_R M & \xrightarrow{\eta_M} & M_S \\ 1 \otimes \varphi \downarrow & & \downarrow \varphi_S \\ R_S \otimes_R N & \xrightarrow{\eta_N} & N_S \end{array} \quad (37)$$

Let  $(1/s) \otimes u \in R_S \otimes_R M$ . Then

$$\begin{aligned} (\varphi_S \eta_M) \left( \frac{1}{s} \otimes u \right) &= \varphi_S \left( \eta_M \left( \frac{1}{s} \otimes u \right) \right) \\ &= \varphi_S \left( \frac{u}{s} \right) \\ &= \frac{\varphi(u)}{s} \\ &= \eta_N \left( \frac{1}{s} \otimes \varphi(u) \right) \\ &= \eta_N \left( (1 \otimes \varphi) \left( \frac{1}{s} \otimes u \right) \right) \\ &= (\eta_N (1 \otimes \varphi)) \left( \frac{1}{s} \otimes u \right). \end{aligned}$$

Therefore the diagram (36) commutes. □

### 5.4.2 Localization is Essentially Surjective

**Proposition 5.9.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then the localization functor  $-_S$  is essentially surjective.*

*Proof.* Let  $M$  be an  $R_S$ -module. Then  $M$  is also an  $R$ -module via the action

$$a \cdot u = \frac{a}{1} \cdot u$$

for all  $a \in R$  and  $u \in M$ . Then  $R_S \otimes_R M$  is an  $R_S$ -module via the action

$$\frac{a}{s} \cdot \left( \frac{b}{t} \otimes u \right) = \frac{ab}{st} \otimes u$$

for all  $a/s$  and  $b/t$  in  $R_S$  and for all  $u \in M$ . We claim that  $M$  is isomorphic to  $R_S \otimes_R M$  as  $R_S$ -modules. Indeed, let  $\varphi: R_S \otimes_R M \rightarrow M$  be given by

$$\varphi \left( \frac{1}{s} \otimes u \right) = \frac{1}{s} \cdot u$$

for all  $(1/s) \otimes u \in R_S \otimes M$ . This map is well-defined and  $R$ -linear since the corresponding map  $R_S \times M \rightarrow M$ , given by

$$\left( \frac{a}{s}, u \right) \mapsto \frac{a}{s} \cdot u$$

is  $R$ -bilinear. This map is injective since if  $(1/s) \cdot u = 0$ , then  $u = 0$ , which implies  $(1/s) \otimes u = 0$ . Finally, the map is surjective since if  $u \in M$ , then  $\varphi((1/1) \otimes u) = u$ . Therefore localization is essentially surjective since  $M_S \cong R_S \otimes_R M$ .  $\square$

## 5.5 Properties of Localization

The following proposition is used quite often:

**Proposition 5.10.** *Let  $N$  be an  $R$ -module and let  $L$  and  $M$  be  $R$ -submodules of  $N$ . The following are equivalent:*

1.  $L = M$ ;
2.  $L_{\mathfrak{p}} = M_{\mathfrak{p}}$  for all prime ideals  $\mathfrak{p} \subseteq R$ ;
3.  $L_{\mathfrak{m}} = M_{\mathfrak{m}}$  for all maximal ideals  $\mathfrak{m} \subseteq R$ .

*Proof.* That 1 implies 2 and that 2 implies 3 are obvious. So it suffices to show 3 implies 1. First we show  $M \subseteq L$ . Let  $u \in M$ . If  $L :_R u = R$ , then  $u \in L$  (since  $1 \cdot u \in L$ ). Otherwise  $L :_R u$  is contained in some maximal ideal  $\mathfrak{m}$ . Then observe that  $u/1 \notin L_{\mathfrak{m}}$ . Indeed, we have  $u/1 \in L_{\mathfrak{m}}$  if and only if there exists an  $s \in R \setminus \mathfrak{m}$  such that  $su \in L$ , but since  $\mathfrak{m}$  is the set of all such  $s$ , we see that  $u/1 \notin L_{\mathfrak{m}}$ . This contradicts the fact that  $M_{\mathfrak{m}} = L_{\mathfrak{m}}$ . Thus we must have  $L :_R u = R$ , which implies  $u \in L$ . Thus  $M \subseteq L$ . The reverse inclusion is proved similarly.  $\square$

### 5.5.1 Localization Commutes with Arbitrary Sums, Finite Intersections, and Radicals

**Proposition 5.11.** *Let  $S \subseteq R$  be a multiplicative set, let  $M$  be an  $R$ -module, and let  $\{M_{\lambda}\}$  be a collection of  $R$ -submodules of  $M$  indexed over a set  $\Lambda$ . Then*

1. *Localization commutes with arbitrary sums:  $(\sum_{\lambda \in \Lambda} M_{\lambda})_S = \sum_{\lambda \in \Lambda} (M_{\lambda})_S$ .*
2. *Localization commutes with finite intersections: if  $\Lambda = \{1, \dots, n\}$  is finite, then  $(\bigcap_{i=1}^n M_i)_S = \bigcap_{i=1}^n (M_i)_S$ .*
3. *Localization commutes with radicals: let  $I \subseteq R$  be an ideal. Then  $(\sqrt{I})_S = \sqrt{I_S}$ .*

*Proof.*

1. Let  $u/s \in (\sum_{\lambda \in \Lambda} M_{\lambda})_S$ . So  $s \in S$  and  $u \in \sum_{\lambda \in \Lambda} M_{\lambda}$ , which means we can express it in the form

$$u = u_{\lambda_1} + \dots + u_{\lambda_n}$$

where  $u_{\lambda_i} \in M_{\lambda_i}$  for all  $1 \leq i \leq n$ . Then

$$\begin{aligned} \frac{u}{s} &= \frac{u_{\lambda_1} + \dots + u_{\lambda_n}}{s} \\ &= \frac{u_{\lambda_1}}{s} + \dots + \frac{u_{\lambda_n}}{s} \\ &\in \sum_{\lambda \in \Lambda} (M_{\lambda})_S. \end{aligned}$$

Therefore  $(\sum_{\lambda \in \Lambda} M_{\lambda})_S \subseteq \sum_{\lambda \in \Lambda} (M_{\lambda})_S$ .

Conversely, suppose  $\sum_{i=1}^n u_{\lambda_i}/s_{\lambda_i} \in \sum_{\lambda \in \Lambda} (M_{\lambda})_S$  where  $u_{\lambda_i} \in M_{\lambda_i}$  and  $s_{\lambda_i} \in S$  for all  $1 \leq i \leq n$ . Then

$$\begin{aligned} \sum_{i=1}^n \frac{u_{\lambda_i}}{s_{\lambda_i}} &= \sum_{i=1}^n \frac{s_{\lambda_1} \cdots s_{\lambda_{i-1}} u_{\lambda_i} s_{\lambda_{i+1}} \cdots s_{\lambda_n}}{s_{\lambda_1} \cdots s_{\lambda_n}} \\ &= \frac{1}{s_{\lambda_1} \cdots s_{\lambda_n}} \sum_{i=1}^n s_{\lambda_1} \cdots s_{\lambda_{i-1}} u_{\lambda_i} s_{\lambda_{i+1}} \cdots s_{\lambda_n} \\ &\in \left( \sum_{\lambda \in \Lambda} M_{\lambda} \right)_S. \end{aligned}$$

Therefore  $(\sum_{\lambda \in \Lambda} M_{\lambda})_S \supseteq \sum_{\lambda \in \Lambda} (M_{\lambda})_S$ .

2. Let  $u/s \in (\cap_{i=1}^n M_i)_S$ . So  $u \in \cap_{i=1}^n M_i$  and  $s \in S$ . This means  $u \in M_i$  for all  $1 \leq i \leq n$ . Thus  $u/s \in \cap_{i=1}^n (M_i)_S$ . This implies  $(\cap_{i=1}^n M_i)_S \subseteq \cap_{i=1}^n (M_i)_S$ .

Conversely, let  $u/s \in \cap_{i=1}^n (M_i)_S$ . Then  $u/s = u_i/s_i$  where  $u_i \in M_i$  and  $s_i \in S$  for all  $1 \leq i \leq n$ . For each  $1 \leq i \leq n$ , choose  $s'_i \in S$  such that  $s'_i s_i u = s'_i s u_i$ . Then

$$\begin{aligned} \frac{u}{s} &= \frac{s'_1 s_1 \cdots s'_n s_n u}{s'_1 s_1 \cdots s'_n s_n s} \\ &\in \left( \bigcap_{i=1}^n M_i \right)_S. \end{aligned}$$

This implies  $(\cap_{i=1}^n M_i)_S \supseteq \cap_{i=1}^n (M_i)_S$ .

3. Let  $x/s \in (\sqrt{I})_S$ . Then  $s \in S$  and  $x \in \sqrt{I}$ , which means  $x^n \in I$  for some  $n \in \mathbb{N}$ . Then

$$\begin{aligned} \left( \frac{x}{s} \right)^n &= \frac{x^n}{s^n} \\ &\in I_S \end{aligned}$$

which implies  $x/s \in \sqrt{I_S}$ . Therefore  $(\sqrt{I})_S \subseteq \sqrt{I_S}$ .

Conversely, let  $x/s \in \sqrt{I_S}$ . Then  $(x/s)^n \in I_S$  for some  $n \in \mathbb{N}$ . So  $x^n \in I$ , which implies  $x \in \sqrt{I}$ . Therefore  $(\sqrt{I})_S \supseteq \sqrt{I_S}$ .  $\square$

## 5.6 Total Ring of Fractions

**Definition 5.4.** Let  $A$  be a ring and let  $S$  be the set of all nonzerodivisors in  $A$ . We define the **total ring of fractions** of  $A$  to be  $Q(A) := S^{-1}A$ .

**Proposition 5.12.** Let  $A$  be a ring and  $B = A/(\mathfrak{p}_1 \cap \cdots \cap \mathfrak{p}_r)$  with  $\mathfrak{p}_i \subset A$  prime ideals. Then

$$Q(B) \cong \bigoplus_{i=1}^r Q(A/\mathfrak{p}_i).$$

In particular,  $Q(B)$  is a direct sum of fields.

*Proof.* Let  $S = A \setminus (\mathfrak{p}_1 \cup \cdots \cup \mathfrak{p}_r)$ . Then

$$\begin{aligned} S^{-1}B &= S^{-1}(A/(\mathfrak{p}_1 \cap \cdots \cap \mathfrak{p}_r)) \\ &\cong S^{-1}A/S^{-1}(\mathfrak{p}_1 \cap \cdots \cap \mathfrak{p}_r) \\ &= S^{-1}A/(S^{-1}\mathfrak{p}_1 \cap \cdots \cap S^{-1}\mathfrak{p}_r) \\ &\cong \bigoplus_{i=1}^r (S^{-1}A/S^{-1}\mathfrak{p}_i) \\ &\cong \bigoplus_{i=1}^r (S^{-1}(A/\mathfrak{p}_i)) \end{aligned}$$

Finally, we have  $S^{-1}B = \overline{S}^{-1}B = Q(B)$  and  $S^{-1}(A/\mathfrak{p}_i) = \overline{S}^{-1}(A/\mathfrak{p}_i) = Q(A/\mathfrak{p}_i)$ .  $\square$

Let  $S = A \setminus (\mathfrak{p}_1 \cup \cdots \cup \mathfrak{p}_r)$ . Then

$$\begin{aligned} S^{-1}B &= S^{-1}(A/(Q_1 \cap \cdots \cap Q_r)) \\ &\cong S^{-1}A/S^{-1}(Q_1 \cap \cdots \cap Q_r) \\ &= S^{-1}A/(S^{-1}Q_1 \cap \cdots \cap S^{-1}Q_r) \\ &\cong \bigoplus_{i=1}^r (S^{-1}A/S^{-1}Q_i) \\ &\cong \bigoplus_{i=1}^r (S^{-1}(A/Q_i)) \end{aligned}$$

Finally, we have  $S^{-1}B = \bar{S}^{-1}B = Q(B)$  and  $S^{-1}(A/\mathfrak{p}_i) = \bar{S}^{-1}(A/\mathfrak{p}_i) = Q(A/\mathfrak{p}_i)$ . The maximal ideals in  $S^{-1}A$  are  $S^{-1}\mathfrak{p}_i$ . Assume  $S^{-1}Q_i$  and  $S^{-1}Q_j$  are not relatively prime. Then  $S^{-1}Q_i + S^{-1}Q_j \subset S^{-1}\mathfrak{p}_k$  for some  $k$ . This implies  $Q_i + Q_j \subset \mathfrak{p}_k$ , which implies  $\mathfrak{p}_i \subset \mathfrak{p}_k$  and  $\mathfrak{p}_j \subset \mathfrak{p}_k$ , which is a contradiction.

**Proposition 5.13.** *Let  $S$  and  $T$  be two multiplicatively closed sets in the ring  $A$ . Define  $ST = \{st \mid s \in S \text{ and } t \in T\}$ . Then*

1.  $ST$  is multiplicatively closed.
2. There exists an isomorphism  $\varphi : i(T)^{-1}(S^{-1}A) \rightarrow (ST)^{-1}A$ , where  $i(T)$  is the multiplicative set given by

$$i(T) = \left\{ \frac{t}{s} \mid t \in T, s \in S \right\}.$$

In particular, if  $S \subset T$ , then  $i(T)^{-1}(S^{-1}A) \cong T^{-1}A$ .

*Proof.*

1. Suppose  $s_1t_1$  and  $s_2t_2$  are two elements in  $ST$ . Then

$$(s_1t_1)(s_2t_2) = (s_1s_2)(t_1t_2) \in ST.$$

Also,  $1 = 1 \cdot 1 \in ST$ . Therefore  $ST$  is multiplicatively closed.

2. Let  $\varphi : i(T)^{-1}(S^{-1}A) \rightarrow (ST)^{-1}A$  be given by mapping  $(a/s_1)/(t/s_2)$  to  $as_2/s_1t$ . We first need to check that this is well-defined. Suppose  $(a'/s'_1)/(t'/s'_2) \sim (a/s_1)/(t/s_2)$ . This means there exists a  $t''/s'' \in i(T)$  such that

$$\frac{t''}{s''} \left( \frac{a't}{s'_1s_2} - \frac{at'}{s_1s'_2} \right) = 0,$$

which means that there exists an  $s \in S$  such that

$$st''(a'ts_1s'_2 - at's'_1s_2) = 0.$$

But this implies that  $as_2/s_1t \sim a's'_2/s'_1t'$  since  $st'' \in ST$ . Therefore  $\varphi$  is well-defined. The map  $\varphi$  is clearly surjective. We will show that  $\varphi$  is also injective. Suppose  $as_2/s_1t = 0$ . This implies that there exists  $st' \in ST$  such that  $st'as_2 = 0$ . But this implies  $(a/s_1)/(t/s_2) = 0$  since  $(t'/1) \in i(T)$  with

$$\frac{t'}{1} \frac{a}{s_1} = \frac{at'}{s_1} = 0,$$

since  $ss_2 \in S$  with  $ss_2(at') = 0$ . Finally, that  $\varphi$  is in fact an  $A$ -module morphism is easy to verify, and we leave as an exercise for the reader. □

**Lemma 5.3.** *Let  $A$  be a Noetherian ring and let  $S$  be the set of all zerodivisors. Then*

$$S = \bigcup_{\mathfrak{p} \in \text{Ass}(\langle 0 \rangle)} \mathfrak{p}.$$

*Proof.* Let  $a \in A$  be a zerodivisor. Then there exists a nonzero  $b \in A$  such that  $ab = 0$ . Let  $I$  denote the ideal  $0 : b$ . Then  $I$  has a primary decomposition, since  $A$  is Noetherian, as

$$I = Q_1 \cap \cdots \cap Q_k,$$

where  $\mathfrak{p}_i = \sqrt{Q_i}$  are the associated prime ideals. Moreover, there exists  $b_i \in A$  such that  $\mathfrak{p}_i = I : b_i = 0 : bb_i$ . Then  $\mathfrak{p}_i$  are associated prime ideals of  $A$  and  $a \in I \subset \mathfrak{p}_i$  implies  $a \in \bigcup_{\mathfrak{p} \in \text{Ass}(\langle 0 \rangle)} \mathfrak{p}$ . Therefore  $S \subset \bigcup_{\mathfrak{p} \in \text{Ass}(\langle 0 \rangle)} \mathfrak{p}$ . The reverse inclusion is trivial. □

**Proposition 5.14.** Let  $A$  be a Noetherian ring and let  $\mathfrak{p} \in \text{Ass}(\langle 0 \rangle)$ . Then

$$A_{\mathfrak{p}} = Q(A)_{\mathfrak{p}Q(A)}.$$

*Proof.* Let  $S$  be the set of all nonzerodivisors and let  $T = A \setminus \mathfrak{p}$ . Then  $S \subset T$  by Lemma (5.3). Therefore

$$Q(A)_{\mathfrak{p}Q(A)} = i(T)^{-1}(S^{-1}A) \cong T^{-1}A = A_{\mathfrak{p}}$$

by Proposition (5.13). □

**Lemma 5.4.** Let  $A$  be a ring,  $S \subset A$  be a multiplicatively closed subset and  $M, N$  be  $A$ -modules with  $N \subset M$ . Then

$$(M/N)_S \cong M_S/N_S.$$

*Proof.* Let  $\varphi : (M/N)_S \rightarrow M_S/N_S$  be the map given by  $\varphi(\overline{m}/s) \mapsto \overline{m/s}$ . The map is easily seen to be well-defined:

$$\varphi(\overline{m+n}/s) = \overline{(m+n)/s} = \overline{m/s}.$$

It is also clearly surjective. To show that it is injective, suppose  $\varphi(\overline{m}/s) = \overline{m/s} = \overline{0}$ . Then  $m/s = n/s'$  for some  $n/t \in N_S$ . This implies there exists  $s'' \in A \setminus \mathfrak{p}$  such that  $s''s'm = s''sn$ . But then  $\overline{m}/s = 0$ , since  $\overline{s''s'm} = \overline{s''sn} = 0$ , with  $s''s' \in A \setminus \mathfrak{p}$ . □

**Proposition 5.15.** Let  $A$  be a ring,  $S \subset A$  a multiplicatively closed subset,  $N, M$  be  $A$ -modules, and  $\varphi : M \rightarrow N$  be an  $A$ -module homomorphism. Then

1.  $\text{Ker}(\varphi_S) = \text{Ker}(\varphi)_S$ .
2.  $\text{Im}(\varphi_S) = \text{Im}(\varphi)_S$ .
3.  $\text{Coker}(\varphi_S) = \text{Coker}(\varphi)_S$ .

*Remark.* In particular, localization with respect to  $S$  is an **exact functor**. That is, if  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$  is an exact sequence of  $A$ -modules, then  $0 \rightarrow M'_S \rightarrow M_S \rightarrow M''_S \rightarrow 0$  is an exact sequence of  $A_S$ -modules.

*Proof.*

1. Suppose  $m/s \in \text{Ker}(\varphi_S)$ . This implies there exists  $s' \in A \setminus \mathfrak{m}$  such that  $s'\varphi(m) = \varphi(s'm) = 0$ . But then  $s'm \in \text{Ker}(\varphi)$ , and  $m/s = s'm/s's \in \text{Ker}(\varphi)_S$ . Conversely, suppose  $m/s \in \text{Ker}(\varphi)_S$ . Then  $\varphi_S(m/s) = \varphi(m)/s = 0$ , and therefore  $m/s \in \text{Ker}(\varphi_S)$ .
2. Suppose  $\varphi_S(m/s) \in \text{Im}(\varphi_S)$ . Then  $\varphi_S(m/s) = \varphi(m)/s \in \text{Im}(\varphi)_S$ . Conversely, suppose  $\varphi(m)/s \in \text{Im}(\varphi)_S$ . Then  $\varphi(m)/s = \varphi_S(m/s) \in \text{Im}(\varphi_S)$ .
3. Finally, using Lemma (5.4), we have

$$\begin{aligned} \text{Coker}(\varphi_S) &= N_S/\text{Im}(\varphi_S) \\ &= N_S/\text{Im}(\varphi)_S \\ &= (N/\text{Im}(\varphi))_S \\ &= \text{Coker}(\varphi)_S. \end{aligned}$$

□

**Proposition 5.16.** Let  $A$  be a ring and let  $M$  be an  $A$ -module. The following conditions are equivalent:

1.  $M = \langle 0 \rangle$ .
2.  $M_{\mathfrak{p}} = \langle 0 \rangle$  for all prime ideals  $\mathfrak{p}$ .
3.  $M_{\mathfrak{m}} = \langle 0 \rangle$  for all maximal ideals  $\mathfrak{m}$ .

*Proof.* (1) implies (2) and (2) implies (3) is obvious. To prove (3) implies (1), assume  $m$  is a nonzero element in  $M$ . Then  $\text{Ann}(m)$  is an ideal in  $A$ , hence it must be contained in a maximal ideal in  $A$ , say  $\mathfrak{m}$ . However, this would imply that  $M_{\mathfrak{m}} \neq 0$  since  $m/1$  would be a nonzero element: Everything which kills  $m$ , is contained in  $\mathfrak{m}$ . We have reached a contradiction, and therefore there are no nonzero elements in  $M$ , in other words  $M = \langle 0 \rangle$ . □

**Proposition 5.17.** Let  $A$  be a ring,  $M$  an  $A$ -module and  $N, L$  submodules of  $M$ . Then  $N = L$  if and only if  $N_{\mathfrak{m}} = L_{\mathfrak{m}}$  for all maximal ideals  $\mathfrak{m}$  in  $A$ .

*Proof.* If  $N = L$ , then we certainly have  $N_{\mathfrak{m}} = L_{\mathfrak{m}}$  for all prime ideals  $\mathfrak{m}$ . Conversely, suppose  $N_{\mathfrak{m}} = L_{\mathfrak{m}}$  for all prime ideals  $\mathfrak{m}$ . To obtain a contradiction, assume there exists an  $n \in N$  such that  $n \notin L$ . Then  $L :_A n = \{a \in A \mid an \in L\}$  is a proper ideal in  $A$  since  $1 \notin L :_A n$ . Therefore it is contained in a maximal ideal, say  $\mathfrak{m}$ . But this implies  $N_{\mathfrak{m}} \neq L_{\mathfrak{m}}$ , since  $n/1 \in N_{\mathfrak{m}}$  but  $n/1 \notin L_{\mathfrak{m}}$ . If  $n/1 = \ell/s$  for some  $\ell \in L$ , then there exists some  $s' \in A \setminus \mathfrak{m}$  such that  $s'sn = s'\ell \in L$ , but  $s's \notin \mathfrak{m} \supset n :_A L$ , which is a contradiction. Therefore we must have  $N \subset L$ . By the same reasoning, we can show  $L \subset N$ . Therefore  $L = N$ .  $\square$

**Corollary.** Let  $A$  be a ring,  $N, M$  be  $A$ -modules, and  $\varphi : M \rightarrow N$  be an  $A$ -module homomorphism. Then

1.  $\varphi$  is injective if and only if  $\varphi_{\mathfrak{m}}$  is surjective for all maximal ideals  $\mathfrak{m}$ .
2.  $\varphi$  is surjective if and only if  $\varphi_{\mathfrak{m}}$  is injective for all maximal ideals  $\mathfrak{m}$ .

*Proof.*

1. Suppose  $\varphi_{\mathfrak{m}}$  is injective for all maximal ideals  $\mathfrak{m}$  in  $A$ . Then  $0 \cong \text{Ker}(\varphi_{\mathfrak{m}}) \cong \text{Ker}(\varphi)_{\mathfrak{m}}$  for all maximal ideals  $\mathfrak{m}$  in  $A$ . Therefore by Proposition (5.16), we must have  $\text{Ker}(\varphi) \cong 0$ . Conversely, suppose  $\varphi$  is injective. Then  $\text{Ker}(\varphi) \cong 0$  implies  $0 \cong \text{Ker}(\varphi)_{\mathfrak{m}} \cong \text{Ker}(\varphi_{\mathfrak{m}})$  for all maximal ideals  $\mathfrak{m}$  in  $A$ .
2. Suppose  $\varphi_{\mathfrak{m}}$  is surjective for all maximal ideals  $\mathfrak{m}$  in  $A$ . Then  $N_{\mathfrak{m}} = \text{Im}(\varphi_{\mathfrak{m}}) = \text{Im}(\varphi)_{\mathfrak{m}}$  for all maximal ideals  $\mathfrak{m}$  in  $A$ . Therefore  $N = \text{Im}(\varphi)$ , by Proposition (5.17). Conversely, suppose  $\varphi$  is surjective. Then  $N = \text{Im}(\varphi)$  implies  $N_{\mathfrak{m}} = \text{Im}(\varphi)_{\mathfrak{m}}$ , which implies  $\varphi_{\mathfrak{m}}$  is surjective for all maximal ideals  $\mathfrak{m}$  in  $A$ .  $\square$

**Proposition 5.18.** Let  $A$  be a ring,  $\mathfrak{p}_1, \dots, \mathfrak{p}_r$  be prime ideals in  $A$ , and  $\langle 0 \rangle \neq M$  a finitely generated  $A$ -module such that  $M_{\mathfrak{p}_i} \neq \langle 0 \rangle$  for all  $i$ . Then there exists  $m \in M$  such that  $m/1 \notin \mathfrak{p}_i M_{\mathfrak{p}_i}$  for all  $i$ .

*Proof.* Nakayama's lemma implies that  $M_{\mathfrak{p}_i}/\mathfrak{p}_i M_{\mathfrak{p}_i} \neq 0$ . Therefore we may choose  $m_i/1 \in M_{\mathfrak{p}_i}$  such that if  $am_i \in \mathfrak{p}_i M$ , then  $a \in \mathfrak{p}_i$ . In particular, this means  $m_i/1 \notin \mathfrak{p}_i M_{\mathfrak{p}_i}$  for all  $i$ . We now want to glue these local solutions together. Start with  $m_i/1 \in M_{\mathfrak{p}_i}$  and  $m_j/1 \in M_{\mathfrak{p}_j}$ . If  $m_i/1 \notin \mathfrak{p}_j M_{\mathfrak{p}_j}$ , then ignore the  $m_j/1$  term and keep the  $m_i/1$  term. Similarly, if  $m_j/1 \notin \mathfrak{p}_i M_{\mathfrak{p}_i}$ , then drop  $m_i/1$  and keep the  $m_j/1$  term. If both  $m_i/1 \in \mathfrak{p}_j M_{\mathfrak{p}_j}$  and  $m_j/1 \in \mathfrak{p}_i M_{\mathfrak{p}_i}$ , then add the terms  $m_i/1$  and  $m_j/1$  to get  $(m_i + m_j)/1$ . Now assume, we have constructed an element  $m/1 \notin \mathfrak{p}_i M_{\mathfrak{p}_i}$  for  $i = 1, 2, \dots, k-1$ , and assume  $m/1 \in \mathfrak{p}_k M_{\mathfrak{p}_k}$ . Choose  $x_i \in \mathfrak{p}_i$  such that  $x_i \notin \mathfrak{p}_k$  for all  $i = 1, 2, \dots, k-1$ . Then  $x_1 x_2 \cdots x_{k-1} m_k/1 \in \mathfrak{p}_i M_{\mathfrak{p}_i}$  for  $i = 1, 2, \dots, k-1$  and  $x_1 x_2 \cdots x_{k-1} m_k/1 \notin \mathfrak{p}_k M_{\mathfrak{p}_k}$ . This implies  $m/1 + x_1 x_2 \cdots x_{k-1} m_k/1 = (m + x_1 x_2 \cdots x_{k-1} m_k)/1 \notin \mathfrak{p}_i M_{\mathfrak{p}_i}$  for  $i = 1, 2, \dots, k$ .  $\square$

A key fact about localization is that every linear map  $\varphi : M \rightarrow N$  of  $A_{\mathfrak{p}}$ -modules comes from the localization of a linear map of  $A$ -modules. That is, we have a commutative diagram

$$\begin{array}{ccc} M & \xrightarrow{\varphi} & N \\ \uparrow & & \uparrow \\ M \otimes_A A_{\mathfrak{p}} & \xrightarrow{\varphi_{\mathfrak{p}}} & N \otimes_A A_{\mathfrak{p}} \end{array}$$

where the vertical arrows are isomorphisms, given by mapping  $m \otimes 1/s$  to  $m/s$  and  $n \otimes 1/s$  to  $n/s$  respectively. Thus, when we talk about a linear map of  $A_{\mathfrak{p}}$ -modules, we may assume it has the form  $\varphi_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ .

## 5.7 Localization commutes with Hom and Tensor Products

**Lemma 5.5.** Let  $A$  be a ring,  $\mathfrak{p}$  an ideal in  $A$ , and  $M, N$   $A$ -modules. Then there exists an injective linear  $\Psi : \text{Hom}_A(N, M)_{\mathfrak{p}} \rightarrow \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}})$ . Moreover, if  $N$  is finitely presented, then this map is also surjective, and hence an isomorphism.

*Proof.* Define  $\Psi_N : \text{Hom}_A(N, M)_{\mathfrak{p}} \rightarrow \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}})$  by sending the element  $\varphi/s \in \text{Hom}_A(N, M)_{\mathfrak{p}}$  to map  $\Psi_N(\varphi/s)$  given by:

$$\Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{n}{t}\right) = \frac{\varphi(n)}{st}.$$

We need to be sure this is well-defined. Let  $\varphi'/s'$  be another representation, so that there exists an  $s'' \notin \mathfrak{p}$  such that  $s''s'\varphi = s''s\varphi'$ . Then

$$\begin{aligned} \Psi_N\left(\frac{\varphi'}{s'}\right)\left(\frac{n}{t}\right) &= \frac{\varphi'(n)}{s't} \\ &= \frac{\varphi(n)}{st}, \end{aligned}$$

since  $s''st\varphi'(n) = s''s't\varphi(n)$  for all  $n/t \in N_{\mathfrak{p}}$ . Next, we check that  $\Psi_N(\varphi/s)$  is  $A_{\mathfrak{p}}$ -linear:

$$\begin{aligned}\Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{t'n + tn'}{tt'}\right) &= \frac{\varphi(t'n + tn')}{stt'} \\ &= \frac{t'\varphi(n) + t\varphi(n')}{stt'} \\ &= \frac{\varphi(n)}{st'} + \frac{\varphi(n')}{st'} \\ &= \Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{n}{t}\right) + \Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{n'}{t'}\right),\end{aligned}$$

for all  $n/t$  and  $n'/t'$  in  $N_{\mathfrak{p}}$ , and

$$\begin{aligned}\Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{a}{u} \cdot \frac{n}{t}\right) &= \frac{\varphi(an)}{sut} \\ &= \frac{a}{u} \cdot \frac{\varphi(n)}{st} \\ &= \frac{a}{u} \cdot \Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{n}{t}\right).\end{aligned}$$

for all  $a/u$  in  $A_{\mathfrak{p}}$  and  $n/t$  in  $N_{\mathfrak{p}}$ . So  $\Psi_N(\varphi/s) \in \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}})$ . Next, suppose

$$\Psi_N\left(\frac{\varphi}{s}\right)\left(\frac{n}{t}\right) = 0,$$

for all  $n/t \in N_{\mathfrak{p}}$ . Then there exists an  $u_n \in A \setminus \mathfrak{p}$  such that  $u_n\varphi(n) = 0$  for all  $n \in N$ . But this implies  $\varphi/s = 0$ , so  $\Psi_N$  is injective.

Now we want to show the second part of the lemma. First assume that  $N$  is a free  $A$ -module with basis  $e_1, \dots, e_k$ . Then  $N_{\mathfrak{p}}$  is a free  $A_{\mathfrak{p}}$ -module with basis  $e_1/1, \dots, e_k/1$ . Suppose  $\varphi \in \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}})$ . Then  $\varphi$  is completely determined by where it maps the basis elements, say,  $\varphi(e_i/1) = m_i/s_i$  for all  $i = 1, \dots, k$ . Define  $\varphi_i \in \text{Hom}_A(N, M)$  by

$$\varphi_i(e_j) = \begin{cases} s_i & \text{if } i = j, \\ 0 & \text{otherwise.} \end{cases}$$

Then  $\varphi_1/s_1 + \dots + \varphi_k/s_k \in \text{Hom}_A(N, M)_{\mathfrak{p}}$ , and  $\Psi_N(\varphi_1/s_1 + \dots + \varphi_k/s_k) = \varphi$  since they act the same on the basis vectors  $e_1/1, \dots, e_k/1$ . If, now,  $N$  is a finitely presented  $A$ -module, then there is an exact sequence

$$A^t \longrightarrow A^s \longrightarrow N \longrightarrow 0$$

Since  $\text{Hom}_A(-, M)$  is a left exact contravariant functor, and localization preserves homology, we obtain a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Hom}_A(N, M)_{\mathfrak{p}} & \longrightarrow & \text{Hom}_A(A^s, M)_{\mathfrak{p}} & \longrightarrow & \text{Hom}_A(A^t, M)_{\mathfrak{p}} \\ & & \downarrow \Psi_N & & \downarrow \Psi_{A^s} & & \downarrow \Psi_{A^t} \\ 0 & \longrightarrow & \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}}) & \longrightarrow & \text{Hom}_{A_{\mathfrak{p}}}(A_{\mathfrak{p}}^s, M_{\mathfrak{p}}) & \longrightarrow & \text{Hom}_{A_{\mathfrak{p}}}(A_{\mathfrak{p}}^t, M_{\mathfrak{p}}) \end{array}$$

Since  $\Psi_{A^s}$  and  $\Psi_{A^t}$  are isomorphisms, and easy diagram chase tells us that there must exist a unique isomorphism  $\Psi_N : \text{Hom}_A(N, M)_{\mathfrak{p}} \rightarrow \text{Hom}_{A_{\mathfrak{p}}}(N_{\mathfrak{p}}, M_{\mathfrak{p}})$  which makes this diagram commute.  $\square$

**Lemma 5.6.** *Let  $A$  be a ring,  $\mathfrak{p}$  an ideal in  $A$ , and  $M, N$   $A$ -modules. Then  $N_{\mathfrak{p}} \otimes_A M_{\mathfrak{p}} = N_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}} = (N \otimes_A M)_{\mathfrak{p}}$ .*

*Remark.* Notice that we are saying  $N_{\mathfrak{p}} \otimes_A M_{\mathfrak{p}}$  is literally the same set as  $N_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$  and  $(N \otimes_A M)_{\mathfrak{p}}$ .

*Proof.* For the first identity, we just need to show that  $\frac{n}{s} \otimes m = n \otimes \frac{m}{s}$  for every  $m \in M$ ,  $n \in N$  and  $s \in A \setminus \mathfrak{p}$ . We have

$$\begin{aligned}\frac{n}{s} \otimes m &= \frac{n}{s} \otimes \frac{sm}{s} \\ &= \frac{sn}{s} \otimes \frac{m}{s} \\ &= n \otimes \frac{m}{s}.\end{aligned}$$

For second identity, we show that every element in  $N_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$  has the form  $\frac{(n_1 \otimes m_1 + \dots + n_k \otimes m_k)}{s}$ , where  $s \in A \setminus \mathfrak{p}$ . Start with an arbitrary element  $\frac{n_1}{s_1} \otimes m_1 + \dots + \frac{n_k}{s_k} \otimes m_k$  in  $N_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ , where  $s_i \in A \setminus \mathfrak{p}$ . We have

$$\frac{n_1}{s_1} \otimes m_1 + \dots + \frac{n_k}{s_k} \otimes m_k = \frac{1}{s_1 s_2 \dots s_k} (s_2 \dots s_k n_1 \otimes m_1 + \dots + s_1 \dots s_{k-1} n_k \otimes m_k),$$

which proves the claim.  $\square$

## 5.8 Local Rings

**Definition 5.5.** A ring  $A$  is called **local** if it has exactly one maximal ideal  $\mathfrak{m}$ . If  $A$  is local, then we call  $A/\mathfrak{m}$  the **residue field** of  $A$ . Rings with finitely many maximal ideals are called **semi-local**.

**Lemma 5.7.** Let  $A$  be a ring.

1.  $A$  is a local ring if and only if the set of non-units is an ideal (which is then the maximal ideal).
2. Let  $\mathfrak{m} \subset A$  be a maximal ideal such that every element of the form  $1 + a$ , where  $a \in \mathfrak{m}$ , is a unit. Then  $A$  is local.

*Proof.*

1. Let  $A$  be a local ring with maximal ideal  $\mathfrak{m}$  and let  $x \in A$  be a non-unit. Then  $\langle x \rangle \neq 1$ , and so  $\langle x \rangle$  is contained in a maximal ideal. Since there is only one maximal ideal, we must have  $\langle x \rangle \subset \mathfrak{m}$ , i.e.  $x \in \mathfrak{m}$ . Therefore  $\mathfrak{m}$  contains the set of all non-units. Since the set of all non-units already contains  $\mathfrak{m}$ , we see that  $\mathfrak{m}$  is the set of all non-units. To prove the converse, let  $A$  be a ring and let  $\mathfrak{m}$  be the set of all non-units in  $A$ . Suppose  $\mathfrak{m}$  is an ideal and let  $\mathfrak{m}_1$  and  $\mathfrak{m}_2$  be two maximal ideals in  $A$ . Then  $\mathfrak{m} \supset \mathfrak{m}_1$  and  $\mathfrak{m} \supset \mathfrak{m}_2$ . Since  $\mathfrak{m}_1$  and  $\mathfrak{m}_2$  are maximal ideals, we must have equality, thus  $\mathfrak{m}_1 = \mathfrak{m} = \mathfrak{m}_2$ .
2. Let  $u \in A \setminus \mathfrak{m}$ . Since  $\mathfrak{m}$  is maximal,  $\langle \mathfrak{m}, u \rangle = A$  and, hence,  $1 = uv + a$  for some  $v \in A$  and  $a \in \mathfrak{m}$ . By assumption,  $uv = 1 - a$  is a unit. Hence,  $u$  is a unit and  $\mathfrak{m}$  is the set of non-units. The claim follows from (1).

□

## 5.9 The Covariant Functor $-_S$

**Proposition 5.19.** Let  $S$  be a multiplicatively closed subset of  $R$ . We obtain a functor

$$-_S: \mathbf{Mod}_R \rightarrow \mathbf{Mod}_{R_S}$$

from the category of  $R$ -modules to the category of  $R_S$ -modules, where the  $R$ -module  $M$  is assigned to the  $R_S$ -module  $M_S$  and where the  $R$ -linear map  $\varphi: M \rightarrow M'$  is assigned to the  $R_S$ -linear map  $\varphi_S: M_S \rightarrow M'_S$ , where  $\varphi_S$  is defined by

$$\varphi_S \left( \frac{u}{s} \right) = \frac{\varphi(u)}{s}$$

for all  $u/s \in M_S$ .

*Proof.* We need to check that  $-_S$  preserves compositions and identities. We first check that it preserves compositions. Let  $\varphi: M \rightarrow M'$  and  $\varphi': M' \rightarrow M''$  be two  $R$ -linear maps and let  $u/s \in M_S$ . Then

$$\begin{aligned} (\varphi'_S \varphi_S) \left( \frac{u}{s} \right) &= \varphi'_S \left( \varphi_S \left( \frac{u}{s} \right) \right) \\ &= \varphi'_S \left( \frac{\varphi(u)}{s} \right) \\ &= \frac{\varphi'(\varphi(u))}{s} \\ &= \frac{(\varphi' \varphi)(u)}{s} \\ &= (\varphi' \varphi)_S \left( \frac{u}{s} \right). \end{aligned}$$

It follows that  $\varphi'_S \varphi_S = (\varphi' \varphi)_S$ . Hence  $-_S$  preserves compositions. Next we check that  $-_S$  preserves identities. Let  $M$  be an  $R$ -module and  $u/s \in M_S$ . Then we have

$$\begin{aligned} (1_M)_S \left( \frac{u}{s} \right) &= \frac{1_M(u)}{s} \\ &= \frac{u}{s} \\ &= 1_{M_S} \left( \frac{u}{s} \right). \end{aligned}$$

It follows that  $(1_M)_S = 1_{M_S}$ . Hence  $-_S$  preserves identities.

□

### 5.9.1 Natural Isomorphism from $-_S$ to $-\otimes_R R_S$

**Proposition 5.20.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then there exists a natural isomorphism*

$$\tau: -\otimes_R R_S \rightarrow -_S$$

*of functors.*

*Proof.* Let  $M$  be an  $R$ -module. We first observe that every tensor in  $M \otimes_R R_S$  can be expressed as an elementary tensor of the form  $u \otimes (1/s)$  where  $u \in M$  and  $s \in S$ . Indeed, let  $\sum_{i=1}^k u_i \otimes (a_i/s_i)$  be any tensor. Then we have

$$\begin{aligned} u_1 \otimes \frac{a_1}{s_1} + \cdots + u_k \otimes \frac{a_k}{s_k} &= u_1 \otimes \frac{a_1 s_2 \cdots s_k}{s_1 s_2 \cdots s_k} + \cdots + u_k \otimes \frac{s_1 \cdots s_{k-1} a_k}{s_1 s_2 \cdots s_k} \\ &= (a_1 s_2 \cdots s_k u_1 + \cdots + s_1 \cdots s_{k-1} a_k u_k) \otimes \frac{1}{s_1 s_2 \cdots s_k} \\ &= \tilde{u} \otimes \frac{1}{\tilde{s}}, \end{aligned}$$

where

$$\tilde{u} = a_1 s_2 \cdots s_k u_1 + \cdots + s_1 \cdots s_{k-1} a_k u_k \in M \quad \text{and} \quad \tilde{s} = s_1 s_2 \cdots s_k \in S.$$

Define  $\tau_M: M \otimes_R R_S \rightarrow M_S$  by

$$\tau_M \left( u \otimes \frac{1}{s} \right) = \frac{u}{s}$$

for all  $u \otimes (1/s) \in M \otimes_R R_S$ . The map  $\tau_M$  is easily checked to be well-defined, surjective, and an  $R$ -linear map (in fact an  $R_S$ -linear map). To show it is injective, let  $u \otimes (1/s) \in \ker \tau_M$ . Then since  $\varphi(u)/s = 0$ , we may choose a  $t \in S$  such that  $t\varphi(u) = 0$ . Then

$$\begin{aligned} u \otimes \frac{1}{s} &= u \otimes \frac{t}{st} \\ &= tu \otimes \frac{1}{st} \\ &= 0 \otimes \frac{1}{st} \\ &= 0. \end{aligned}$$

Thus  $\ker \tau_M = 0$ , which implies  $\tau_M$  is injective.

Thus for each  $R$ -module  $M$ , we obtain an isomorphism  $\tau_M: M \otimes_R R_S \rightarrow M_S$ . We claim that  $\tau$  is natural in  $M$ , so that it is a natural isomorphism. Indeed, let  $\varphi: M \rightarrow M'$  be an  $R$ -linear map. We need to check that the following diagram commutes

$$\begin{array}{ccc} M \otimes_R R_S & \xrightarrow{\tau_M} & M_S \\ \varphi \otimes 1 \downarrow & & \downarrow \varphi_S \\ M' \otimes_R R_S & \xrightarrow{\tau_{M'}} & M'_S \end{array} \quad (38)$$

Let  $u \otimes \frac{1}{s} \in M \otimes_R R_S$ . Then we have

$$\begin{aligned} (\varphi_S \tau_M) \left( u \otimes \frac{1}{s} \right) &= \varphi_S \left( \tau_M \left( u \otimes \frac{1}{s} \right) \right) \\ &= \varphi_S \left( \frac{u}{s} \right) \\ &= \frac{\varphi(u)}{s} \\ &= \tau_{M'} \left( \varphi(u) \otimes \frac{1}{s} \right) \\ &= \tau_{M'} \left( (\varphi \otimes 1) \left( u \otimes \frac{1}{s} \right) \right) \\ &= (\tau_{M'}(\varphi \otimes 1)) \left( u \otimes \frac{1}{s} \right). \end{aligned}$$

□

**Corollary.** *Let  $S$  be a multiplicatively closed subset of  $R$ . Then  $-_S$  is exact.*

*Proof.* The functor  $-\otimes_R R_S$  is exact since  $R_S$  is a flat  $R$ -module. Thus  $-_S$  must be exact too since  $-_S$  is naturally isomorphic to  $-\otimes_R R_S$ . □

### 5.9.2 Localization is Essentially Surjective

Throughout the rest of this section, let  $S$  be a multiplicatively closed subset of  $R$ .

**Proposition 5.21.** *Localization is essentially surjective.*

*Proof.* Let us first show that localization is essentially surjective. Let  $M$  be an  $R_S$ -module. Then  $M$  is also an  $R$ -module via the action

$$a \cdot u = \frac{a}{1} \cdot u$$

for all  $a \in R$  and  $u \in M$ . Then  $R_S \otimes_R M$  is an  $R_S$ -module via the action

$$\frac{a}{s} \cdot \left( \frac{b}{t} \otimes u \right) = \frac{ab}{st} \otimes u$$

for all  $a/s$  and  $b/t$  in  $R_S$  and for all  $u \in M$ . We claim that  $M$  is isomorphic to  $R_S \otimes_R M$  as  $R_S$ -modules. Indeed, let  $\varphi: R_S \otimes_R M \rightarrow M$  be given by

$$\varphi \left( \frac{1}{s} \otimes u \right) = \frac{1}{s} \cdot u$$

for all  $(1/s) \otimes u \in R_S \otimes M$ <sup>4</sup>. This map is well-defined and linear since the corresponding map  $R_S \times M \rightarrow M$ , given by  $(a/s, u) \mapsto (a/s) \cdot u$ , is bilinear. This map is injective since if  $(1/s) \cdot u = 0$ , then  $u = 0$ , which implies  $(1/s) \otimes u = 0$ . Finally, the map is surjective since if  $u \in M$ , then  $\varphi((1/1) \otimes u) = u$ . Therefore localization is essentially surjective since  $M_S \cong R_S \otimes_R M$ .  $\square$

## 6 Hom

Let  $M$  and  $N$  be  $R$ -modules. We denote by  $\text{Hom}_R(M, N)$  to be the set of all  $R$ -linear maps from  $M$  to  $N$ . In fact,  $\text{Hom}_R(M, N)$  is more than just a set, it is an abelian group, where addition is defined pointwise: if  $\varphi, \psi \in \text{Hom}_R(M, N)$ , then we define  $\varphi + \psi \in \text{Hom}_R(M, N)$  to be the  $R$ -linear map given by

$$(\varphi + \psi)(u) = \varphi(u) + \psi(u)$$

for all  $u \in M$ . If  $R$  is commutative, then  $\text{Hom}_R(M, N)$  is more than just an abelian group; it has the structure of an  $R$ -module, where scalar multiplication is defined pointwise: if  $\varphi \in \text{Hom}_R(M, N)$  and  $a \in R$ , then we define  $a\varphi \in \text{Hom}_R(M, N)$  to be the  $R$ -linear map given by

$$(a\varphi)(u) = \varphi(au)$$

for all  $u \in M$ . Note that if  $R$  is not commutative, then  $a\varphi$  is  $R$ -linear if and only if  $a \in Z(R)$ . Indeed, given  $a, b \in R$ , we have

$$\begin{aligned} (a\varphi)(bu) &= \varphi(abu) \\ &= \varphi(bau) \\ &= b\varphi(au) \\ &= b(a\varphi)(u), \end{aligned}$$

where we were allowed to commute  $a$  and  $b$  since  $a \in Z(R)$ .

### 6.1 Properties of Hom

#### 6.1.1 Universal Mapping Property for Products

**Proposition 6.1.** *Let  $M$  be an  $R$ -module, let  $I$  be an index set, and let  $N_i$  be an  $R$ -module for each  $i \in I$ . Then*

1.  $\text{Hom}_R(\bigoplus_{i \in I} N_i, M) \cong \prod_{i \in I} \text{Hom}_R(N_i, M)$ .
2.  $\text{Hom}_R(M, \prod_{i \in I} N_i) \cong \prod_{i \in I} \text{Hom}_R(M, N_i)$
3. *If, moreover,  $M$  is finitely generated, then  $\text{Hom}_R(M, \bigoplus_{i \in I} N_i) \cong \bigoplus_{i \in I} \text{Hom}_R(M, N_i)$ .*

*Remark.* In other words, the contravariant functor  $\text{Hom}_R(-, M)$  takes direct sums to direct products, the covariant functor  $\text{Hom}_R(M, -)$  takes direct products to direct products, and if  $M$  is finitely-generated, then the covariant functor  $\text{Hom}_R(M, -)$  also takes direct sums to direct sums.

<sup>4</sup>Note that every element in  $R_S \otimes_R M$  can be put into an elementary tensor form  $(1/s) \otimes u$ .

*Proof.* 1. For each  $i \in I$ , let  $\iota_i: N_i \rightarrow \bigoplus_{i \in I} N_i$  denote the  $i$ th inclusion map. Define a map  $\Psi: \text{Hom}_R(\bigoplus_{i \in I} N_i, M) \rightarrow \prod_{i \in I} \text{Hom}_R(N_i, M)$  by

$$\Psi(\varphi) = (\varphi|_{N_i}) = (\varphi \circ \iota_i)$$

for all  $\varphi \in \text{Hom}_R(\bigoplus_{i \in I} N_i, M)$ . The map  $\Psi$  is  $R$ -linear as it is a composition of  $R$ -linear maps in each component. To see that it is an isomorphism, we construct an inverse map. Define a map  $\Phi: \prod_{i \in I} \text{Hom}_R(N_i, M) \rightarrow \text{Hom}_R(\bigoplus_{i \in I} N_i, M)$  by

$$\Phi((\varphi_i))(y_{i_1} + \cdots + y_{i_n}) = \varphi_{i_1}(y_{i_1}) + \cdots + \varphi_{i_n}(y_{i_n})$$

for all  $(\varphi_i) \in \prod_{i \in I} \text{Hom}_R(N_i, M)$  and  $y_{i_1} + \cdots + y_{i_n} \in \bigoplus_{i \in I} N_i$ .

Let us check that  $\Psi$  is indeed the inverse to  $\Phi$ . Let  $\varphi \in \text{Hom}_R(\bigoplus_{i \in I} N_i, M)$  and let  $y_{i_1} + \cdots + y_{i_n} \in \bigoplus_{i \in I} N_i$ . Then

$$\begin{aligned} (\Phi\Psi)(\varphi)(y_{i_1} + \cdots + y_{i_n}) &= \Phi(\varphi|_{N_i})(y_{i_1} + \cdots + y_{i_n}) \\ &= \varphi|_{N_{i_1}}(y_{i_1}) + \cdots + \varphi|_{N_{i_n}}(y_{i_n}) \\ &= \varphi(y_{i_1}) + \cdots + \varphi(y_{i_n}) \\ &= \varphi(y_{i_1} + \cdots + y_{i_n}). \end{aligned}$$

It follows that  $\Phi\Psi = 1$ .

Conversely, let  $(\varphi_i) \in \prod_{i \in I} \text{Hom}_R(N_i, M)$ . Observe that for each  $i \in I$ , we have

$$(\Phi(\varphi_i) \circ \iota_i)(y) = \varphi_i(y)$$

for all  $y \in N_i$ . It follows that  $\Phi(\varphi_i) \circ \iota_i = \varphi_i$ . Therefore

$$\begin{aligned} (\Psi\Phi)((\varphi_i)) &= \Psi(\Phi(\varphi_i)) \\ &= (\Phi(\varphi_i) \circ \iota_i) \\ &= (\varphi_i). \end{aligned}$$

This implies  $\Psi\Phi = 1$ .

2. Define a map  $\Psi: \text{Hom}_R(M, \prod_{i \in I} N_i) \rightarrow \prod_{i \in I} \text{Hom}_R(M, N_i)$  by

$$\Psi(\varphi) = (\pi_i \circ \varphi)_{i \in I}$$

for all  $\varphi \in \text{Hom}_R(M, \prod_{i \in I} N_i)$ , where  $\pi_i: \prod_{i \in I} N_i \rightarrow N_i$  is the projection to the  $i$ th coordinate. We claim that  $\Psi$  is an isomorphism.

We first check that it is  $R$ -linear. Let  $a, b \in R$  and  $\varphi, \psi \in \text{Hom}_R(M, \prod_{i \in I} N_i)$ . Then

$$\begin{aligned} \Psi(a\varphi + b\psi) &= (\pi_i \circ (a\varphi + b\psi)) \\ &= (a(\pi_i \circ \varphi) + b(\pi_i \circ \psi)) \\ &= a(\pi_i \circ \varphi) + b(\pi_i \circ \psi) \\ &= a\Psi(\varphi) + b\Psi(\psi). \end{aligned}$$

Thus  $\Psi$  is  $R$ -linear. To show that  $\Psi$  is an isomorphism, we construct its inverse. Let  $(\varphi_i) \in \prod_{i \in I} \text{Hom}_R(M, N_i)$ . Define  $\Phi((\varphi_i)): M \rightarrow \prod_{i \in I} N_i$  by

$$\Phi((\varphi_i))(x) := (\varphi_i(x))$$

for all  $x \in M$ . Then clearly  $\Phi$  and  $\Psi$  are inverse to each other. Indeed, let  $\varphi \in \text{Hom}_R(M, \prod_{i \in I} N_i)$ . Then

$$\begin{aligned} \Phi(\Psi(\varphi))(x) &= \Phi((\pi_i \circ \varphi))(x) \\ &= ((\pi_i \circ \varphi)(x)) \\ &= \varphi(x) \end{aligned}$$

for all  $x \in M$ . Thus  $\Phi(\Psi(\varphi)) = \varphi$ . Conversely, let  $(\varphi_i) \in \prod_{i \in I} \text{Hom}_R(M, N_i)$ . Then

$$\begin{aligned} \Psi(\Phi(\varphi_i)) &= (\pi_i \circ \Phi(\varphi_i)) \\ &= (\pi_i \circ \varphi_i) \\ &= \varphi_i \end{aligned}$$

3. Let  $\varphi \in \bigoplus_{i \in I} \text{Hom}_R(M, N_i)$  and let

$$\varphi = \sum_{k=1}^n \varphi_{i_k}$$

be the unique decomposition of  $\varphi$ , where  $\varphi_{i_k} \in \text{Hom}_R(M, N_{i_k})$  for each  $1 \leq k \leq n$ . We can view  $\varphi$  as an element in  $\text{Hom}_R(M, \bigoplus_{i \in I} N_i)$ . Indeed, for each  $x \in M$ , we have

$$\varphi(x) = \sum_{k=1}^n \varphi_{i_k}(x) \in \bigoplus_{i \in I} N_i.$$

Thus we have

$$\bigoplus_{i \in I} \text{Hom}_R(M, N_i) \subset \text{Hom}_R\left(M, \bigoplus_{i \in I} N_i\right).$$

For the other direction, suppose that  $\{x_1, \dots, x_n\}$  is a generating set for  $M$  and let  $\varphi \in \text{Hom}_R(M, \bigoplus_{i \in I} N_i)$ . For each  $1 \leq k \leq n$ , let

$$\varphi(x_k) = y_{i_{1,k}} + \dots + y_{i_{n_k,k}}$$

be the unique decomposition of  $\varphi(x_k)$ . It follows that

$$\varphi(M) \subset \bigoplus_{\substack{1 \leq k \leq n \\ 1 \leq j \leq n_k}} N_{i_{j,k}}.$$

In particular, we may view  $\varphi$  as an element in

$$\begin{aligned} \text{Hom}_R\left(M, \bigoplus_{\substack{1 \leq k \leq n \\ 1 \leq j \leq n_k}} N_{i_{j,k}}\right) &\cong \bigoplus_{\substack{1 \leq k \leq n \\ 1 \leq j \leq n_k}} \text{Hom}_R(M, N_{i_{j,k}}) \\ &\subset \bigoplus_{i \in I} \text{Hom}_R(M, N_i). \end{aligned}$$

□

### 6.1.2 Hom Commutes with Localization Under Certain Conditions

Recall that the localization functor  $-_S$  is essentially surjective. This means that every  $R_S$ -module is isomorphic to an  $R_S$ -module of the form  $M_S$  where  $M$  is an  $R$ -module. We now want to show that the localization functor is faithful, but not necessarily full.

**Lemma 6.1.** *Let  $S$  be a multiplicatively closed subset of  $R$  and let  $M$  and  $N$  be  $R$ -modules. Then there exists an injective  $R_S$ -linear map*

$$\Psi: \text{Hom}_R(M, N)_S \rightarrow \text{Hom}_{R_S}(M_S, N_S).$$

*Moreover, if  $M$  is finitely presented, then this map is also surjective, and hence an isomorphism.*

*Proof.* We define  $\Psi: \text{Hom}_R(M, N)_S \rightarrow \text{Hom}_{R_S}(M_S, N_S)$  by

$$\Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{u}{t}\right) = \frac{\varphi(u)}{st}. \quad (39)$$

for all  $\varphi/s \in \text{Hom}_R(M, N)_S$  and  $u/t \in M_S$ . We need to check that (38) is well-defined. Let  $\varphi'/s'$  and  $u'/t'$  be two different representations of  $\varphi/s$  and  $u/t$  respectively. Choose  $s'', t'' \in S$  such that  $s''s'\varphi = s''s\varphi'$  and  $t''t'u = t''tu'$ . Then

$$\begin{aligned} \Psi_M\left(\frac{\varphi'}{s'}\right)\left(\frac{u'}{t'}\right) &= \frac{\varphi'(u')}{s't'} \\ &= \frac{s''s\varphi'(t''tu')}{s''st''ts't'} \\ &= \frac{s''s'\varphi(t''tu)}{s''st''ts't'} \\ &= \frac{\varphi(u)}{st}. \end{aligned}$$

Thus (38) is well-defined.

Next, we check that  $\Psi_M(\varphi/s)$  is  $R_S$ -linear: we have

$$\begin{aligned}\Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{t'u + tu'}{tt'}\right) &= \frac{\varphi(t'u + tu')}{stt'} \\ &= \frac{t'\varphi(u) + t\varphi(u')}{stt'} \\ &= \frac{\varphi(u)}{st'} + \frac{\varphi(u')}{st'} \\ &= \Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{u}{t}\right) + \Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{u'}{t'}\right),\end{aligned}$$

for all  $u/t$  and  $u'/t'$  in  $M_S$ , and

$$\begin{aligned}\Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{a}{t'} \cdot \frac{u}{t}\right) &= \frac{\varphi(au)}{st't} \\ &= \frac{a}{t'} \cdot \frac{\varphi(u)}{st} \\ &= \frac{a}{t'} \cdot \Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{u}{t}\right).\end{aligned}$$

for all  $a/t'$  in  $R_S$  and  $u/t$  in  $M_S$ . Thus  $\Psi_M(\varphi/s)$  is  $R_S$ -linear.

Finally, we check that  $\Psi$  is injective. Suppose

$$\Psi_M\left(\frac{\varphi}{s}\right)\left(\frac{u}{t}\right) = 0,$$

for all  $u/t \in N_p$ . Then there exists an  $s_u \in S$  such that  $s_u\varphi(u) = 0$  for all  $u \in M$ . But this implies  $\varphi/s = 0$ , so  $\Psi_M$  is injective.

Now we want to show the second part of the lemma. First assume that  $M$  is a finite free  $R$ -module with basis  $e_1, \dots, e_m$ . Then  $M_S$  is a free  $R_S$ -module with basis  $e_1/1, \dots, e_m/1$ . Suppose  $\varphi \in \text{Hom}_{R_S}(M_S, N_S)$ . Then  $\varphi$  is completely determined by where it maps the basis elements, say,

$$\varphi\left(\frac{e_i}{1}\right) = \frac{v_i}{t_i}$$

for all  $i = 1, \dots, m$ . For each  $1 \leq i \leq m$ , let  $\varphi_i: M \rightarrow N$  be the unique  $R$ -linear map such that

$$\varphi_i(e_j) = \begin{cases} v_i & \text{if } i = j, \\ 0 & \text{otherwise.} \end{cases}$$

Then

$$\frac{\varphi_1}{t_1} + \dots + \frac{\varphi_m}{t_m} \in \text{Hom}_R(M, N)_S \quad \text{and} \quad \Psi_M\left(\frac{\varphi_1}{t_1} + \dots + \frac{\varphi_m}{t_m}\right) = \varphi$$

since they act the same on the basis vectors  $e_1/1, \dots, e_m/1$ . Thus, in the case where  $M$  is a finite free  $R$ -module, the map  $\Psi_M$  is surjective.

Now we assume that  $M$  is a finitely presented  $R$ -module, then there is an exact sequence

$$G \longrightarrow F \longrightarrow M \longrightarrow 0$$

where  $F$  and  $G$  are finite free  $R$ -modules. The since  $\text{Hom}_R(-, N)$  is left exact contravariant and  $-_S$  is exact covariant, we obtain a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Hom}_R(M, N)_S & \longrightarrow & \text{Hom}(F, N)_S & \longrightarrow & \text{Hom}(G, N)_S \\ & & \downarrow \Psi_M & & \downarrow \Psi_F & & \downarrow \Psi_G \\ 0 & \longrightarrow & \text{Hom}_{R_S}(M_S, N_S) & \longrightarrow & \text{Hom}_{R_S}(F_S, N_S) & \longrightarrow & \text{Hom}_{R_S}(G_S, N_S) \end{array}$$

where the columns are isomorphisms. An easy diagram chase tells us that

$$\Psi_M: \text{Hom}_R(M, N)_S \rightarrow \text{Hom}_{R_S}(M_S, N_S)$$

is the unique isomorphism which makes this diagram commute. □

## 6.2 Functorial Properties of $\text{Hom}$

### 6.2.1 The Covariant Functor $\text{Hom}_R(M, -)$

**Proposition 6.2.** *Let  $M$  be an  $R$ -module. We obtain a covariant functor*

$$\text{Hom}_R(M, -): \mathbf{Mod}_R \rightarrow \mathbf{Mod}_R$$

*from the category of  $R$ -modules to itself, where the  $R$ -module  $N$  is assigned to the  $R$ -module  $\text{Hom}_R(M, N)$  and where the  $R$ -linear map  $\varphi: N \rightarrow N'$  is assigned to the  $R$ -linear map  $\varphi_*: \text{Hom}_R(M, N) \rightarrow \text{Hom}_R(M, N')$ , where  $\varphi_*$  is defined by*

$$\varphi_*(\psi) = \varphi\psi$$

*for all  $\psi \in \text{Hom}_R(M, N)$ .*

*Proof.* We need to check that  $\text{Hom}_R(M, -)$  preserves compositions and identities. We first check that it preserves compositions. Let  $\varphi: N \rightarrow N'$  and  $\varphi': M' \rightarrow N''$  be two  $R$ -linear maps and let  $\psi \in \text{Hom}_R(M, N)$ . Then we have

$$\begin{aligned} (\varphi'\varphi)_*(\psi) &= \varphi'\varphi\psi \\ &= \varphi'_*(\varphi\psi) \\ &= \varphi'_*(\varphi_*(\psi)) \\ &= (\varphi'_*\varphi_*)(\psi) \end{aligned}$$

It follows that  $(\varphi'\varphi)_* = \varphi'_*\varphi_*$ . Hence  $\text{Hom}_R(M, -)$  preserves compositions. Next we check that  $\text{Hom}_R(M, -)$  preserves identities. Let  $N$  be an  $R$ -module and let  $\psi \in \text{Hom}_R(M, N)$ . Then we have

$$\begin{aligned} (1_N)_*(\psi) &= 1_N\psi \\ &= \psi \\ &= 1_{\text{Hom}_R(M, N)}(\psi). \end{aligned}$$

It follows that  $(1_N)_* = 1_{\text{Hom}_R(M, N)}$ . Hence  $\text{Hom}_R(M, -)$  preserves identities. □

### 6.2.2 The Contravariant Functor $\text{Hom}_R(-, N)$

**Proposition 6.3.** *Let  $N$  be an  $R$ -module. We obtain a contravariant functor*

$$\text{Hom}_R(-, N): \mathbf{Mod}_R \rightarrow \mathbf{Mod}_R$$

*from the category of  $R$ -modules to itself, where the  $R$ -module  $M$  is assigned to the  $R$ -module  $\text{Hom}_R(M, N)$  and where the  $R$ -linear map  $\varphi: M \rightarrow M'$  is assigned to the  $R$ -linear map  $\varphi^*: \text{Hom}_R(M', N) \rightarrow \text{Hom}_R(M, N)$ , where  $\varphi^*$  is defined by*

$$\varphi^*(\psi') = \psi'\varphi$$

*for all  $\psi' \in \text{Hom}_R(M', N)$ .*

*Proof.* We need to check that  $\text{Hom}_R(-, N)$  preserves compositions and identities. We first check that it preserves compositions. Let  $\varphi: M \rightarrow M'$  and  $\varphi': M' \rightarrow M''$  be two  $R$ -linear maps and let  $\psi'' \in \text{Hom}_R(M'', N)$ . Then we have

$$\begin{aligned} (\varphi'\varphi)^*(\psi'') &= \psi''\varphi'\varphi \\ &= (\varphi'^*(\psi''))\varphi \\ &= \varphi^*(\varphi'^*(\psi'')) \\ &= (\varphi^*\varphi'^*)(\psi'') \end{aligned}$$

It follows that  $(\varphi'\varphi)^* = (\varphi^*\varphi'^*)$ . Hence  $\text{Hom}_R(-, N)$  preserves compositions. Next we check that  $\text{Hom}_R(-, N)$  preserves identities. Let  $M$  be an  $R$ -module and let  $\psi \in \text{Hom}_R(M, N)$ . Then we have

$$\begin{aligned} (1_M)^*(\psi) &= \psi 1_M \\ &= \psi \\ &= 1_{\text{Hom}_R(M, N)}(\psi). \end{aligned}$$

It follows that  $(1_M)^* = 1_{\text{Hom}_R(M, N)}$ . Hence  $\text{Hom}_R(-, N)$  preserves identities. □

### 6.2.3 Left Exactness of $\text{Hom}_R(-N)$

**Proposition 6.4.** *The sequence of  $R$ -modules*

$$M_1 \xrightarrow{\varphi_1} M_2 \xrightarrow{\varphi_2} M_3 \longrightarrow 0 \quad (40)$$

*is exact if and only if for all  $R$ -modules  $N$  the induced sequence*

$$0 \longrightarrow \text{Hom}_R(M_3, N) \xrightarrow{\varphi_2^*} \text{Hom}_R(M_2, N) \xrightarrow{\varphi_1^*} \text{Hom}_R(M_1, N) \quad (41)$$

*is exact.*

*Proof.* Suppose that (39) is exact and let  $N$  be any  $R$ -module. We first show exactness at  $\text{Hom}_R(M_3, N)$ . Let  $\psi_3 \in \ker \varphi_2^*$ . Then

$$\begin{aligned} 0 &= \varphi_2^*(\psi_3) \\ &= \psi_3 \varphi_2 \\ &= \psi_3, \end{aligned}$$

where we used the fact that  $\varphi_2$  is surjective to obtain the third line from the second line. Therefore  $\varphi_2^*$  is injective, which implies exactness at  $\text{Hom}_R(M_3, N)$ .

Next we show exactness at  $\text{Hom}_R(M_2, N)$ . Let  $\psi_2 \in \ker \varphi_1^*$ . Then

$$\begin{aligned} 0 &= \varphi_1^*(\psi_2) \\ &= \psi_2 \varphi_1 \end{aligned}$$

implies  $\psi_2$  kills the image of  $\varphi_1$ . We define  $\psi_3: M_3 \rightarrow N$  as follows: let  $u_3 \in M_3$ . Choose  $u_2 \in M_2$  such that  $\varphi_2(u_2) = u_3$  (such a choice is possible since  $\varphi_2$  is surjective). We define

$$\psi_3(u_3) = \psi_2(u_2).$$

The map  $\psi_3$  is well-defined since  $\psi_2$  kills the image of  $\varphi_1$ . Indeed, if  $v_2 \in M_2$  was another lift of  $u_3$  under  $\varphi_2$ , then

$$\begin{aligned} v_2 - u_2 &\in \ker \varphi_2 \\ &= \text{im } \varphi_1. \end{aligned}$$

Thus

$$\begin{aligned} \psi_2(v_2) &= \psi_2(v_2 - u_2 + u_2) \\ &= \psi_2(v_2 - u_2) + \psi_2(u_2) \\ &= \psi_2(u_2). \end{aligned}$$

Thus the map  $\psi_3$  is well-defined. The map  $\psi_3$  is also  $R$ -linear. Indeed, let  $a, b \in R$  and let  $u_3, v_3 \in M_3$ . Choose lifts of  $u_3, v_3$  under  $\varphi_2$ , say  $u_2, v_2 \in M_2$  (so  $\varphi_2(u_2) = u_3$  and  $\varphi_2(v_2) = v_3$ ). Then  $au_2 + bv_2$  is easily seen to be a lift of  $au_3 + bv_3$  under  $\varphi$  and so we have

$$\begin{aligned} \psi_3(au_3 + bv_3) &= \psi_2(au_2 + bv_2) \\ &= a\psi_2(u_2) + b\psi_2(v_2) \\ &= a\psi_3(u_3) + b\psi_3(v_3). \end{aligned}$$

Thus  $\psi_3$  is  $R$ -linear. Finally, observe that

$$\begin{aligned} \varphi_2^*(\psi_3)(u_2) &= (\psi_3 \varphi_2)(u_2) \\ &= \psi_3(\varphi_2(u_2)) \\ &= \psi_3(u_3) \\ &= \psi_2(u_2) \end{aligned}$$

for all  $u_2 \in M_2$ . It follows that  $\psi_2 = \varphi_2^*(\psi_3)$ , and hence  $\psi_2 \in \text{im } \varphi_2^*$ . Therefore we have exactness at  $\text{Hom}_R(M_2, N)$ .

Conversely, suppose that (39) is exact for all  $R$ -modules  $N$ . We first show  $\varphi_2$  is surjective. Set  $N = M_3/\text{im } \varphi_2$  and let  $\pi: M_3 \rightarrow M_3/\text{im } \varphi_2$  be the quotient map. Observe that

$$\begin{aligned}\varphi_2^*(\pi) &= \pi\varphi_2 \\ &= 0 \\ &= \varphi_2^*(0).\end{aligned}$$

It follows from injectivity of  $\varphi_2^*$  that  $\pi = 0$ . In other words,  $M_3 = \text{im } \varphi_2$ , hence  $\varphi_2$  is surjective.

Next we show exactness at  $M_2$ . First set  $N = M_3$ . Then exactness of (39) implies

$$\begin{aligned}0 &= (\varphi_1^*\varphi_2^*)(1_{M_3}) \\ &= (\varphi_1^*(\varphi_2^*(1_{M_3}))) \\ &= \varphi_1^*(1_{M_3}\varphi_2) \\ &= 1_{M_3}\varphi_2\varphi_1 \\ &= \varphi_2\varphi_1.\end{aligned}$$

Thus  $\ker \varphi_2 \supseteq \text{im } \varphi_1$ . For the reverse inclusion, set  $N = M_2/\text{im } \varphi_1$  and let  $\pi: M_2 \rightarrow M_2/\text{im } \varphi_1$  be the quotient map. Then

$$\begin{aligned}\varphi_1^*(\pi) &= \pi\varphi_1 \\ &= 0\end{aligned}$$

implies there exists  $\psi_3: M_3 \rightarrow M_2/\text{im } \varphi_1$  such that  $\pi = \varphi_2^*(\psi_3)$  by exactness of (39). Thus, if  $u_2 \in \ker \varphi_2$ , then

$$\begin{aligned}0 &= \psi_3(0) \\ &= \psi_3(\varphi_2(u_2)) \\ &= (\psi_3\varphi_2)(u_2) \\ &= (\varphi_2^*(\psi_3))(u_2) \\ &= \pi(u_2)\end{aligned}$$

implies  $u_2 \in \text{im } \varphi_1$ . Thus  $\ker \varphi_2 \subseteq \text{im } \varphi_1$ . □

#### 6.2.4 Naturality

**Proposition 6.5.** *Let  $\varphi: M \rightarrow M'$  be an  $R$ -linear map. Then we obtain an induced natural transformation*

$$\text{Hom}_R(\varphi, -): \text{Hom}_R(M, -) \rightarrow \text{Hom}_R(M', -)$$

*between functors.*

*Proof.* Let  $\psi: N \rightarrow N'$  be an  $R$ -linear map. We need to check that the following diagram commutes

$$\begin{array}{ccc}\text{Hom}_R(M, N) & \xrightarrow{\varphi^*} & \text{Hom}_R(M', N) \\ \psi_* \downarrow & & \downarrow \psi_* \\ \text{Hom}_R(M, N') & \xrightarrow{\varphi^*} & \text{Hom}_R(M', N')\end{array}\tag{42}$$

Let  $\phi \in \text{Hom}_R(M, N)$ . Then we have

$$\begin{aligned}(\psi_*\varphi^*)(\phi) &= \psi_*(\varphi^*(\phi)) \\ &= \psi_*(\phi\varphi) \\ &= \psi\phi\varphi \\ &= \varphi^*(\psi\phi) \\ &= \varphi^*(\psi_*(\phi)) \\ &= (\varphi^*\psi_*)(\phi).\end{aligned}$$

It follows that  $\psi_*\varphi^* = \varphi^*\psi_*$ , and so the diagram (41) commutes. □

*Remark.* By a similar argument, every  $R$ -linear map  $\psi: N \rightarrow N'$  induces a natural transformation

$$\text{Hom}_R(-, \psi): \text{Hom}_R(-, N) \rightarrow \text{Hom}_R(-, N').$$

## 7 Nakayama's Lemma and its Consequences

Nakayama's Lemma is a powerful tool we use in Commutative Algebra. In order to know Commutative Algebra, one must be familiar with Nakayama's Lemma. Before we state and prove Nakayama's Lemma, we need to discuss the Jacobson radical of a ring.

**Definition 7.1.** The **Jacobson radical** of  $R$ , denoted  $\text{rad}(R)$ , is defined by the formula

$$\text{rad}(R) := \bigcap_{\substack{\mathfrak{m} \subset R \\ \mathfrak{m} \text{ maximal}}} \mathfrak{m}.$$

**Example 7.1.** Suppose  $(R, \mathfrak{m})$  is a local ring. Then  $\text{rad}(R) = \mathfrak{m}$ .

**Proposition 7.1.** Let  $x \in \text{rad}(R)$ . Then  $1 - x \in R^\times$ .

*Proof.* Suppose that  $1 - x \notin R^\times$ . Then there exists a maximal ideal which contains  $1 - x$ , choose  $\mathfrak{m}$  to be this maximal ideal. But then this implies  $x \notin \mathfrak{m}$ , contradicting the fact that  $x \in \text{rad}(R)$ .  $\square$

### 7.1 Nakayama's Lemma

We now state and prove Nakayama's Lemma:

**Lemma 7.1.** (Nakayama). Let  $R$  be a ring, let  $I$  be an ideal contained in  $\text{rad}(R)$ , let  $M$  a finitely generated  $R$ -module, and let  $N \subset M$  a submodule such that  $M = IM + N$ . Then  $M = N$ . In particular, if  $M = IM$ , then  $M = 0$ .

*Proof.* Assume  $M \neq N$ , and let  $u_1, \dots, u_s \in M$  such that their classes form a system of generators of  $M/N$  and where  $s$  is minimal. Since  $u_s \in M = IM + N$ , there exists  $x_1, \dots, x_s \in I$  and  $v \in N$  such that

$$u_s = \sum_{r=1}^s x_r u_r + v.$$

This implies

$$(1 - x_s)u_s = \sum_{r=1}^{s-1} x_r u_r + v.$$

Since  $x_s$  is contained in every maximal ideal,  $1 - x_s$  is a unit in  $R$ , and so

$$u_s = \sum_{r=1}^{s-1} x_r (1 - x_s)^{-1} u_r + (1 - x_s)^{-1} v,$$

which contradicts the minimality of the chosen system of generators.  $\square$

**Corollary.** Let  $(R, \mathfrak{m})$  be a local ring, let  $M$  a finitely-generated  $R$ -module, and let  $u_1, \dots, u_s$  be elements in  $M$  such that their classes form a system of generators for the  $(R/\mathfrak{m})$ -vector space  $M/\mathfrak{m}M$ . Then  $u_1, \dots, u_s$  generates  $M$  as an  $R$ -module.

*Proof.* Since  $\bar{u}_1, \dots, \bar{u}_s$  generates  $M/\mathfrak{m}M$  as an  $(R/\mathfrak{m})$ -vector space, we have

$$M = \mathfrak{m}M + \sum_{r=1}^s Ru_r. \quad (43)$$

Indeed, let  $u \in M$ . Choose  $a_1, \dots, a_s \in R$  such that

$$\bar{u} = \sum_{r=1}^s \bar{a}_r \bar{u}_r = \sum_{r=1}^s a_r \bar{u}_r.$$

This implies  $u - \sum_{r=1}^s a_r u_r \in \mathfrak{m}M$ . Thus

$$u = \left( u - \sum_{r=1}^s a_r u_r \right) + \sum_{r=1}^s a_r u_r,$$

shows us that  $u \in \mathfrak{m}M + \sum_{r=1}^s Ru_r$ . Combining (42) with Nakayama's Lemma, we see that

$$M = \sum_{r=1}^s Ru_r.$$

$\square$

*Remark.* The finite generation hypothesis is crucial. For a counterexample, consider the local ring  $R = \mathbb{Z}_{(p)}$  and the quotient  $R$ -module  $\mathbb{Q}/\mathbb{Z}_{(p)}$ . In this case  $\mathfrak{m} = pR$ , so

$$\begin{aligned} M/\mathfrak{m}M &= M/pM \\ &= 0, \end{aligned}$$

since every element of  $\mathbb{Q}$  has the form  $px$  for some  $x \in \mathbb{Q}$ . However, obviously  $M \neq 0$  (and also  $M$  is not finitely generated as an  $R$ -module in this case).

**Example 7.2.** Let  $R = K[x, y, z]_{\langle x, y, z \rangle}$ , let  $\mathfrak{m} = \langle x, y, z \rangle$ , and let  $M$  be the  $R$ -module with presentation

$$R^2 \xrightarrow{\begin{pmatrix} 0 & y \\ xy-1 & xz \\ xy+1 & xz \end{pmatrix}} R^3 \longrightarrow M \longrightarrow 0.$$

Let  $u_i \in M$  be the image of the standard basis element  $e_i \in R^3$  for  $i = 1, 2, 3$ . The set  $\{u_1, u_2, u_3\}$  is *not* a minimal generating set of  $M$ . Indeed, since the functor  $- \otimes_R (R/\mathfrak{m})$  is right-exact, we obtain a presentation of the  $(R/\mathfrak{m})$ -vector space  $M/\mathfrak{m}M$ :

$$(R/\mathfrak{m})^2 \xrightarrow{\begin{pmatrix} 0 & 0 \\ -1 & 0 \\ 1 & 0 \end{pmatrix}} (R/\mathfrak{m})^3 \longrightarrow M/\mathfrak{m}M \longrightarrow 0$$

This presentation matrix has rank 1, and so  $M/\mathfrak{m}M$  is a 2-dimensional  $K$ -vector space. In fact, it's not hard to see that

$$M/\mathfrak{m}M = K\bar{u}_1 + K\bar{u}_3,$$

since the equation  $-\bar{u}_2 + \bar{u}_3 = 0$  tells us that  $\bar{u}_2$  is superfluous. According to Nakayama's Lemma, we should be able to lift  $\bar{u}_1, \bar{u}_3 \in M/\mathfrak{m}M$  to a minimal generating set of  $M$ . In particular,  $\{u_1, u_3\}$  should be a minimal generating set of  $M$ . To see that it is, we use the fact that  $xy - 1$  is a unit in  $R$  to perform the following sequence of elementary row and column operations:

$$\begin{pmatrix} 0 & y \\ xy-1 & xz \\ xy+1 & xz \end{pmatrix} \longrightarrow \begin{pmatrix} 0 & y \\ xy-1 & xz \\ 0 & \frac{-2xz}{xy-1} \end{pmatrix} \longrightarrow \begin{pmatrix} 0 & y \\ xy-1 & 0 \\ 0 & \frac{-2xz}{xy-1} \end{pmatrix} \longrightarrow \begin{pmatrix} 0 & y \\ 1 & 0 \\ 0 & \frac{-2xz}{xy-1} \end{pmatrix}.$$

Letting  $\{e'_1, e'_2\}$  denote the standard basis for  $R^2$ , then this sequence of elementary row operations corresponds to base changes:

$$\{e_1, e_2, e_3\} \rightarrow \{e_1, (xy-1)e_2 + (xy+1)e_3, e_3\} \quad \text{and} \quad \{e'_1, e'_2\} \rightarrow \left\{e'_1, \frac{-xz}{xy-1}e'_1 + e'_2\right\}.$$

So we see that  $\begin{pmatrix} 0 & y \\ 1 & 0 \\ 0 & \frac{-2xz}{xy-1} \end{pmatrix}$  can be used as a presentation matrix for  $M$ . Again, the trivial condition  $u_2 = 0$  implies that we can toss  $u_2$  out, so that

$$M = Ru_1 + Ru_3.$$

## 7.2 Krull's Intersection Theorem

We now prove the following important corollary of Nakayama's Lemma:

**Corollary.** (*Krull's intersection theorem*) Let  $R$  be a Noetherian ring, let  $I$  be an ideal contained in the Jacobson radical of  $R$ , and let  $M$  a finitely generated  $R$ -module. Then

$$\bigcap_{k \in \mathbb{N}} I^k M = 0.$$

*Proof.* Let  $N := \bigcap_k I^k M$ . Then  $N$  is a finitely generated  $R$ -module since it is a submodule of the finitely generated module  $M$  over the Noetherian ring  $R$ . By Nakayama's Lemma, it is sufficient to show that  $IN = N$ . Let

$$\mathcal{L} := \{L \subset M \text{ submodule} \mid L \cap N = IN\}.$$

The set  $\mathcal{L}$  is nonempty since  $IN \in \mathcal{L}$ . Since  $R$  is Noetherian, the set  $\mathcal{L}$  has a maximal element, choose  $L \in \mathcal{L}$  to be such a maximal element. It remains to prove that  $I^k M \subset L$  for some  $k$ , because this implies

$$\begin{aligned} N &= I^k M \cap N \\ &\subset L \cap N \\ &= IN, \end{aligned}$$

and from Nakayama's Lemma, we would conclude that  $N = 0$ . Since  $I$  is finitely generated, it suffices to prove that for any  $x \in I$  there is some positive integer  $n \in \mathbb{N}$  such that  $x^n M \subset L$  (If  $I = \langle x_1, \dots, x_s \rangle$  with  $x_r^{n_r} M \subset L$  for each  $1 \leq r \leq s$ , then  $I^{n_1 + \dots + n_s} M \subset L$ ).

Let  $x \in I$  and consider the chain of ideals

$$L :_M x \subset L :_M x^2 \subset \dots.$$

This chain stabilizes because  $R$  is Noetherian. Choose  $n \in \mathbb{N}$  with  $L :_M x^n = L :_M x^{n+1}$ . We claim that  $x^n M \subset L$ . Indeed, by the maximality of  $L$  it is enough to prove that  $(L + x^n M) \cap N \subset IN$  since obviously,

$$\begin{aligned} IN &= L \cap N \\ &\subset (L + x^n M) \cap N. \end{aligned}$$

Let  $u \in (L + x^n M) \cap N$ , so  $u = v + x^n w$ , with  $v \in L$  and  $w \in M$ . Now

$$\begin{aligned} x^{n+1} w &= xu - xv \\ &\in IN + L \\ &= L \cap N + L \\ &= L, \end{aligned}$$

which implies  $w \in L :_M x^{n+1} = L :_M x^n$ . Therefore,  $x^n w \in L$ , and, consequently,  $u \in L$ . This implies  $u \in L \cap N = IN$ .  $\square$

### 7.3 Filtered Rings and Modules

**Definition 7.2.** A **filtered ring** is a ring  $R$  together with a descending sequence  $(I_n)_{n \in \mathbb{Z}_{\geq 0}}$  of ideals in  $R$  which satisfies  $I_0 = R$  and  $R_m R_n \subseteq R_{m+n}$ . A **filtered module** over the filtered ring  $R$  is an  $R$ -module  $M$  together with descending sequence  $(M_n)_{n \in \mathbb{Z}}$  of submodules of  $M$  which satisfies  $M_0 = M$  and  $R_m M_n \subseteq M_{m+n}$ . We often specify a filtered ring in terms of the sequence  $(R_n)$ . Similarly, we often specify a filtered module in terms of its sequence  $(M_n)$ .

**Definition 7.3.** Let  $R$  be a ring and let  $Q$  be an ideal in  $R$ . Then  $(Q^n)$  is a filtered ring. We call  $(Q^n)$  the **standard  $Q$ -filtration** of  $R$ . A filtered module  $(M_n)$  over the filtered ring  $(Q^n)$  is called a  **$Q$ -filtration** of  $M_0$ . Let  $M$  be any  $R$ -module. It is easy to see that if  $(M_n)$  is a descending sequence of submodules of  $M$  such that  $M = M_0$ , then  $(M_n)$  is a  $Q$ -filtration of  $M$  if and only if  $QM_n \subseteq M_{n+1}$  for all  $n \in \mathbb{Z}$ . A  $Q$ -filtration  $(M_n)$  of  $M$  is called **stable** if  $QM_n = M_{n+1}$  for all sufficiently large  $n$ . We denote by  $\mathfrak{F}_Q(M)$  to be the set of all  $Q$ -filtrations of  $M$ . If  $Q$  is understood from context, then we will drop  $Q$  from the subscript and simply write  $\mathfrak{F}(M)$ .

Unless otherwise specified, we fix a ring  $R$ , an ideal  $Q$  in  $R$ , and an  $R$ -module  $M$ . We give  $R$  the structure of a filtered ring via the standard  $Q$ -filtration  $(Q^n)$ . We wish to study  $Q$ -filtrations of  $M$ .

#### 7.3.1 Equivalence Relation $\mathfrak{F}(M)$

**Definition 7.4.** Let  $(M_n)$  and  $(M'_n)$  be two  $Q$ -filtrations of  $M$ . We say  $(M_n) \geq (M'_n)$  if there exists  $d \in \mathbb{N}$  such that  $M_{n+d} \subseteq M'_n$  for all  $n \in \mathbb{N}$ . If  $(M_n) \geq (M'_n)$  and  $(M'_n) \geq (M_n)$ , then we say  $(M_n)$  and  $(M'_n)$  are **equivalent  $Q$ -filtrations** and denoted this by  $(M_n) \sim (M'_n)$ .

**Proposition 7.2.** The relation  $\sim$  is an equivalence relation.

*Proof.* Reflexivity and symmetry of  $\sim$  are clear. To see transitivity also holds, suppose  $(M_n) \sim (M'_n)$  and  $(M'_n) \sim (M''_n)$ . Choose  $d \in \mathbb{N}$  such that  $M_{n+d} \subseteq M'_n$  and  $M'_{n+d} \subseteq M_n$  for all  $n \in \mathbb{N}$  and choose  $d' \in \mathbb{N}$  such that  $M'_{n+d'} \subseteq M''_n$  and  $M''_{n+d'} \subseteq M'_n$ . Then for all  $n \in \mathbb{N}$ , we have

$$M_{n+d+d'} \subseteq M'_{n+d'} \subseteq M''_n.$$

Similarly for all  $n \in \mathbb{N}$ , we have

$$M''_{n+d+d'} \subseteq M'_{n+d} \subseteq M_n.$$

It follows that  $(M_n) \sim (M''_n)$ .  $\square$

*Remark.* Note that if  $(M_n)$  is a stable  $Q$ -filtration, then  $(M_n) \sim (Q^n M)$ . In particular, if  $(M'_n)$  is another stable  $Q$ -filtration, then  $(M_n) \sim (M'_n)$ .

### 7.3.2 Preimage of Filtration is Filtration

**Proposition 7.3.** *Let  $N$  be an  $R$ -module, let  $\varphi: N \rightarrow M$  be an  $R$ -module homomorphism of  $A$ -modules, and let  $(M_n)$  be a  $Q$ -filtration of  $M$ . Then  $(\varphi^{-1}(M_n))$  is a  $Q$ -filtration of  $N$ . Moreover, if  $(M'_n)$  is another  $Q$ -filtration of  $M$  such that  $(M'_n) \sim (M_n)$ , then  $(\varphi^{-1}(M'_n)) \sim (\varphi^{-1}(M_n))$ .*

*Proof.* We first show that  $(\varphi^{-1}(M_n))$  is a  $Q$ -filtration of  $N$ . Clearly  $(\varphi^{-1}(M_n))$  is a descending chain of submodules of  $N$  with  $\varphi^{-1}(M_0) = N$ . Also we have

$$\begin{aligned} Q\varphi^{-1}(M_n) &\subset \varphi^{-1}(QM_n) \\ &\subset \varphi^{-1}(M_{n+1}) \end{aligned}$$

for all  $n \geq 0$ . Thus  $(\varphi^{-1}(M_n))$  is a  $Q$ -filtration of  $N$ .

Now we will show  $(\varphi^{-1}(M_n))$  is equivalent to  $(\varphi^{-1}(M'_n))$ . Choose a positive integer  $k$  such that  $M_{n+k} \subset M'_n$  and  $M'_{n+k} \subset M_n$  for all  $n \geq 0$ . Then  $\varphi^{-1}(M_{n+k}) \subset \varphi^{-1}(M'_n)$  and  $\varphi^{-1}(M'_{n+k}) \subset \varphi^{-1}(M_n)$ . Thus  $(\varphi^{-1}(M_n))$  is equivalent to  $(\varphi^{-1}(M'_n))$ .  $\square$

*Remark.* Thus, a homomorphism of  $R$ -modules  $\varphi: N \rightarrow M$  induces a well-defined map

$$\mathcal{C}_Q^\infty(\varphi): \mathcal{C}_Q^\infty(M) \rightarrow \mathcal{C}_Q^\infty(N).$$

### 7.3.3 Blowups

**Definition 7.5.** The **blowup algebra of  $Q$  in  $R$**  is the graded  $R$ -algebra

$$B_Q(R) := R + Qt + Q^2t^2 + Q^3t^3 + \cdots \cong \bigoplus_{n \geq 0} Q^n,$$

where we view  $t$  as an indeterminate variable which keeps track of the grading: the homogeneous component in degree  $n$  is

$$B_Q(R)_n := Q^n t^n,$$

and where multiplication is uniquely determined by

$$(xt^m)(yt^n) = xyt^{m+n}$$

for all  $xt^m \in Q^m t^m$  and  $yt^n \in Q^n t^n$ . The **blowup module of  $Q$  with respect to  $M$**  is the graded  $R$ -module

$$B_Q(M) := M + QMt + Q^2Mt^2 + Q^3Mt^3 + \cdots \cong \bigoplus_{n \geq 0} Q^n M.$$

where the  $R$ -module action is uniquely determined by

$$(xt^m)(ut^n) = xut^{m+n}$$

for all  $xt^m \in Q^m t^m$  and  $ut^n \in Q^n Mt^n$ .

**Proposition 7.4.** *The blowup algebra  $B_Q(R)$  is a Noetherian ring.*

*Proof.* Since  $R$  is Noetherian,  $Q$  is a finitely-generated  $R$ -ideal, say  $Q = \langle f_1, \dots, f_s \rangle_R$ . This implies that the irrelevant ideal  $QtB_Q(R)$  in  $B_Q(R)$  is a finitely-generated  $B_Q(R)$ -ideal, with  $QtB_Q(R) = \langle f_1t, \dots, f_st \rangle_{B_Q(R)}$ . Therefore there is an  $R$ -algebra homomorphism

$$\varphi: R[X_1, \dots, X_s] \rightarrow B_Q(R)$$

induced by  $\varphi(X_r) = tf_r$  for all  $1 \leq r \leq s$ . This homomorphism is a surjective ring homomorphism from a Noetherian ring, and hence  $B_Q(R)$  is a Noetherian ring.  $\square$

**Example 7.3.** Let  $R = K[x, y]/\langle y^2 - x^3 - x^2 \rangle$ , let  $Q = \langle \bar{x}, \bar{y} \rangle$ , and let

$$\varphi: R[u, v] \rightarrow B_Q(R)$$

be the surjective  $R$ -algebra homomorphism induced by  $u \mapsto \bar{x}t$  and  $v \mapsto \bar{y}t$ . The kernel of  $\varphi$  is an ideal which is homogeneous in the variables  $u, v$

$$\ker \varphi = \langle v^2 - (\bar{x} + 1)u^2, \bar{x}v - \bar{y}u \rangle.$$

In particular,  $B_Q(R)$  corresponds to an algebraic subset  $Z \subset \mathbb{A}^2 \times \mathbb{P}^1$ .

### 7.3.4 Artin-Rees Lemma

In this subsection, suppose  $M$  is finitely-generated. We are almost ready to state and prove Artin-Rees Lemma, but before we do so, let us give a criterion for stability: Let  $(M_n)$  be a  $Q$ -filtration. We set  $\overline{M}$  to be the  $B_Q(R)$ -module given by

$$\overline{M} := M + M_1t + M_2t^2 + \cdots.$$

Furthermore, for each  $n \geq 0$ , let

$$\begin{aligned} \overline{M}_n &:= M + M_1t + \cdots + M_{n-1}t^{n-1} + B_Q(R)M_nt^n \\ &= M + M_1t + \cdots + M_{n-1}t^{n-1} + M_nt^n + QM_nt^{n+1} + Q^2M_nt^{n+2} + \cdots. \end{aligned}$$

Observe that  $\overline{M}_n \subset \overline{M}_{n+1}$  for all  $n \geq 0$  and  $\bigcup_{n=0}^{\infty} \overline{M}_n = \overline{M}$ . Thus the sequence of  $B_Q(R)$ -modules  $(\overline{M}_n)$  is an ascending sequence whose union is  $\overline{M}$ .

**Lemma 7.2.** (Criterion for stability).  $\overline{M}$  is a finitely-generated  $B_Q(R)$ -module if and only if  $(M_n)$  is  $Q$ -stable.

*Proof.* Suppose  $\overline{M}$  is finitely-generated. Then  $\overline{M}$  is Noetherian, and so the ascending sequence  $(\overline{M}_n)$  of submodules of  $\overline{M}$  must terminate, say at  $k \geq 0$ . This implies  $\overline{M}_k = \overline{M}$  since the union of the ascending sequence is  $\overline{M}$ , and this happens if and only if  $M_{n+k} = Q^n M_k$  for all  $n \geq 0$ . Hence  $(M_n)$  is  $Q$ -stable.

Conversely, suppose  $(M_n)$  is  $Q$ -stable. Then as argued above, there exists a  $k \geq 0$  such that  $\overline{M}_k = \overline{M}$ . Choose such a  $k \geq 0$  and observe that the submodules  $M_n$  are finitely-generated  $R$ -modules for all  $n \geq 0$  (and hence finitely-generated  $B_Q(R)$ -modules too). Thus

$$\begin{aligned} \overline{M} &= \overline{M}_k \\ &= M + M_1t + \cdots + M_{k-1}t^{k-1} + B_Q(R)M_kt^k \end{aligned}$$

is a finitely-generated  $B_Q(R)$ -module. □

Now we state and prove Artin-Rees Lemma:

**Lemma 7.3.** (Artin-Rees Lemma) Let  $(M_n)$  be a stable  $Q$ -filtration of  $M$  and let  $N$  be a submodule of  $M$ . Then  $(M_n \cap N)$  is a stable  $Q$ -filtration of  $N$ .

*Proof.* By Proposition (7.3), we know that  $(M_n \cap N)$  is a  $Q$ -filtration of  $N$  since it is the sequence obtained from the inverse image of the inclusion map  $N \hookrightarrow M$ . It remains to show that  $(M_n \cap N)$  is stable. Appealing to (7.2), we just need to show that  $\overline{N}$  is a finitely-generated  $B_Q(R)$ -module, where

$$\overline{N} := N + (M_1 \cap N)t + (M_2 \cap N)t^2 + \cdots.$$

This is clear though since  $\overline{N}$  is a  $B_Q(R)$ -submodule of  $\overline{M}$  which is finitely-generated, and since  $B_Q(R)$  is Noetherian,  $\overline{N}$  must be finitely-generated too. □

### 7.3.5 Consequences of Artin-Rees Lemma

We begin with an alternative proof of Krull's Intersection Theorem:

**Lemma 7.4.** (Krull's Intersection Theorem) Let  $(R, \mathfrak{m})$  be a Noetherian local ring, let  $Q$  be an ideal in  $R$ , and let  $M$  be a finitely-generated  $R$ -module. Then

$$\bigcap_{n \in \mathbb{N}} Q^n M = 0.$$

*Proof.* Set  $N := \bigcap_{n \in \mathbb{N}} Q^n M$ . By Artin-Rees, the  $Q$ -filtration  $(N \cap Q^n M)$  is stable. Thus there exists a positive integer  $k$  such that

$$\begin{aligned} QN &= Q(N \cap Q^k M) \\ &= N \cap Q^{k+1} M \\ &= N, \end{aligned}$$

and by Nakayama's lemma, this implies  $N = 0$ . □

**Proposition 7.5.** Let  $R$  be a Noetherian ring, let  $\mathfrak{p}$  be a prime ideal of  $R$ , and let  $I$  be an ideal of  $R$ . For any homomorphism  $\varphi: I \rightarrow R/\mathfrak{p}$ , there exists a positive integer  $d$  such that  $\varphi$  factors through

$$I/(\mathfrak{p}^d \cap I) \cong (\mathfrak{p}^d + I)/\mathfrak{p}^d.$$

*Proof.* By Artin-Rees,  $(I \cap \mathfrak{p}^n)$  is a stable  $\mathfrak{p}$ -filtration. Therefore there exists a positive integer  $d$  such that  $I \cap \mathfrak{p}^d = \mathfrak{p} (I \cap \mathfrak{p}^{d-1})$ . This implies  $I \cap \mathfrak{p}^d \subset \ker \varphi$ .  $\square$

**Proposition 7.6.** Let  $A$  be a ring,  $Q$  an ideal in  $A$ , and let

$$0 \longrightarrow M_1 \longrightarrow M_2 \longrightarrow M_3 \longrightarrow 0$$

be a short exact sequence of  $A$ -modules. Then

$$0 \longrightarrow B_Q(M_1) \longrightarrow B_Q(M_2) \longrightarrow B_Q(M_3)$$

is exact.

*Proof.*  $\square$

## 7.4 Topology Induced by $Q$ -Filtration

Throughout this subsection, let  $M$  be an  $R$ -module and let  $Q$  be an ideal in  $R$ .

**Definition 7.6.** Let  $(M_n)$  be a  $Q$ -filtration of  $M$ . For each  $u \in M$  and  $m \geq 0$  we define

$$B_{1/m}^{(M_n)}(u) := u + M_m. \quad (44)$$

The reason we write  $1/m$  in the subscript and not  $m$  in the subscript will become apparent soon enough. If the  $Q$ -filtration  $(M_n)$  is understood from context, then we will drop it from the superscript in  $B_{1/m}^{(M_n)}(u)$  in order to clean notation. Next we define

$$\mathcal{B}^{(M_n)} = \{B_{1/m}^{(M_n)}(u) \mid u \in M \text{ and } m \geq 0\}.$$

Again if  $(M_n)$  is understood from context, then we will drop it from the superscript in  $\mathcal{B}^{(M_n)}$ . Finally, let  $\tau(\mathcal{B})$  be the smallest topology which contains  $\mathcal{B}$ . The topology  $\tau(\mathcal{B})$  is called the **topology induced by the filtration**  $(M_n)$ .

**Proposition 7.7.**  $\mathcal{B}$  is a basis for  $\tau(\mathcal{B})$ .

*Proof.* First note that  $\mathcal{B}$  covers  $M$ . Indeed, for any  $m \geq 0$  we have

$$M \subseteq \bigcup_{u \in M} B_{1/m}(u).$$

In fact, we already have  $M = B_0(0)$ ! Next let  $u, v \in M$  and let  $n \geq m \geq 0$ . Then observe that

$$B_{1/m}(u) \cap B_{1/n}(v) = \begin{cases} B_{1/n}(v) & \text{if } u - v \in M_m \\ \emptyset & \text{else} \end{cases}$$

In particular we see that  $\mathcal{B}$  is a basis for  $\tau(\mathcal{B})$ .  $\square$

**Proposition 7.8.** Let  $(M_n)$  and  $(M'_n)$  be two  $Q$ -filtrations of  $M$ . Then  $\tau(\mathcal{B}^{(M_n)}) \supseteq \tau(\mathcal{B}^{(M'_n)})$  if and only if  $(M_n) \geq (M'_n)$ . In particular,  $\tau(\mathcal{B}^{(M_n)}) = \tau(\mathcal{B}^{(M'_n)})$  if and only if  $(M_n) \sim (M'_n)$ .

*Proof.* Observe that  $\tau(\mathcal{B}^{(M_n)}) \supseteq \tau(\mathcal{B}^{(M'_n)})$  if and only if for each  $u + M'_m \in \mathcal{B}^{(M'_n)}$  there exists a  $u + M_{\pi(m)} \in \mathcal{B}^{(M_n)}$  such that  $u + M'_m \supseteq u + M_{\pi(m)}$ , or equivalently, such that  $M'_m \supseteq M_{\pi(m)}$ . Since  $(M_n)$  is descending, this is equivalent to there being some  $d \in \mathbb{N}$  such that  $M'_m \supseteq M_{m+d}$ .  $\square$

**Definition 7.7.** Suppose  $(M_n)$  is a  $Q$ -stable filtration (so  $(M_n) \sim (Q^n M)$ ). Then the topology  $\tau(\mathcal{B}^{(M_n)})$  is called the  **$Q$ -adic topology**. By Proposition (7.8), any choice of a stable  $Q$ -filtration would result in the same topology.

### 7.4.1 Hausdorff Criterion

**Proposition 7.9.** Let  $(M_n)$  be a  $Q$ -filtration of  $M$  and equip  $M$  with the topology induced by  $(M_n)$ . Then  $M$  is Hausdorff if and only if  $\bigcap_{n=1}^{\infty} M_n = 0$ .

*Proof.* Suppose  $\bigcap_{n=1}^{\infty} M_n = 0$  and let  $u, v \in M$  be distinct elements. Since  $\bigcap_{n=1}^{\infty} M_n = 0$ , there exists some  $m \in \mathbb{N}$  such that  $u - v \notin M_m$ . Then note that  $B_{1/m}(u)$  and  $B_{1/m}(v)$  are open neighborhoods of  $u$  and  $v$  respectively, both of which are disjoint from one another. It follows that  $M$  is Hausdorff.

Conversely, suppose  $M$  is Hausdorff and assume for a contradiction that  $\bigcap_{n=1}^{\infty} M_n \neq 0$ . Choose any nonzero  $u \in \bigcap_{n=1}^{\infty} M_n$ . Then  $0$  and  $u$  are two distinct elements of  $M$ , but there does not exist an open neighborhood of  $0$  and an open neighborhood of  $u$  both of which are disjoint from each other. Indeed, if  $U$  is an open neighborhood of  $0$  and  $V$  is an open neighborhood of  $u$ , then we can choose  $n \in \mathbb{N}$  such that  $M_n \subseteq U$  and  $M_n \subseteq V$ . But  $0 \in M_n$  and  $u \in M_n$ , so  $0 \in V$  and  $u \in U$ . Thus  $U$  and  $V$  have nonempty intersection. This is a contradiction as  $M$  is Hausdorff.  $\square$

### 7.4.2 Subspace topology agrees with topology induced by filtration

Let  $M$  be an  $R$ -module equipped with the topology induced by a  $Q$ -filtration  $(M_n)$  of  $M$  and let  $N$  be an  $R$ -submodule of  $M$ . There are two ways give  $N$  a topology. The first way is to give it the subspace topology. The second way is to give it the topology induced by the  $Q$ -filtration  $(M_n \cap N)$  of  $N$ . In fact, these two ways give the same topology:

**Proposition 7.10.** *With the notation above, we have  $\tau(\mathcal{B}^{(M_n)}) \cap N = \tau(\mathcal{B}^{(M_n \cap N)})$ .*

*Proof.* Let  $v \in N$  and  $m \geq 0$ . Then

$$\begin{aligned} B_{1/m}^{(M_n \cap N)}(v) &= v + M_m \cap N \\ &= (v + M_m) \cap N \\ &= B_{1/m}(v) \cap N. \end{aligned}$$

It follows that  $\tau(\mathcal{B}^{(M_n \cap N)})$  and  $\tau(\mathcal{B}^{(M_n)}) \cap N$  have the same basis, and hence  $\tau(\mathcal{B}^{(M_n)}) \cap N = \tau(\mathcal{B}^{(M_n \cap N)})$ .  $\square$

### 7.4.3 Artin-Rees Lemma

Let  $M$  be an  $R$ -module equipped with the topology induced by a  $Q$ -filtration  $(M_n)$  of  $M$  and let  $N$  be an  $R$ -submodule of  $M$ . As we've seen above, the subspace topology of  $N$  and the topology induced by the  $Q$ -filtration  $(M_n \cap N)$  of  $N$  are in fact the same topology. There is another topology that we can give  $N$ . Namely, we consider the topology on  $N$  induced by the  $Q$ -filtration  $(Q^n N)$ . If  $R$  is Noetherian,  $M$  is finitely-generated, and  $(M_n)$  is stable, then the Artin-Rees Lemma tells us that  $\tau(\mathcal{B}^{(Q^n N)}) = \tau(\mathcal{B}^{(M_n \cap N)})$ .

### 7.4.4 Pseudometric Induced by $Q$ -Filtration

Let  $(M_n)$  be a  $Q$ -filtration of  $M$ . Define  $d_{(M_n)}: M \times M \rightarrow \mathbb{N}$  by

$$d_{(M_n)}(u, v) = \begin{cases} 1/n & \text{if } u - v \in M_n \setminus M_{n+1} \\ 0 & \text{if } u - v \in \bigcap_{n \in \mathbb{N}} M_n \end{cases}$$

As usual we suppress  $(M_n)$  from the subscript of  $d_{(M_n)}$  whenever context is clear. Observe that  $d$  is pseudo-metric. Indeed, it is obviously symmetric. It also satisfies the strong triangle inequality:

$$d(u, w) \leq \max(d(u, v), d(v, w))$$

for all  $u, v, w \in M$ . Indeed, suppose  $u, v, w \in M$  such that  $u - v \in M_m \setminus M_{m+1}$  and  $v - w \in M_n \setminus M_{n+1}$ , where without loss of generality, we may assume  $n \geq m$ . Then  $u - w = (u - v) + (v - w) \in M_m$ . Thus we certainly have

$$\begin{aligned} d(u - w) &\leq 1/m \\ &= \max(1/m, 1/n) \\ &= \max(d(u, v), d(v, w)). \end{aligned}$$

Finally note that  $d(u, u) = 0$  for all  $u \in M$ . However there may exist two distinct  $u, v \in M$  such that  $d(u, v) = 0$ . This is why  $d$  is just a pseudo-metric and not a genuine metric: it doesn't necessarily satisfy positive-definiteness. Observe that for each  $u \in M$  and  $m \geq 0$ , we have

$$\begin{aligned} B_{1/m}(u) &= u + M_m \\ &= \{u + v \mid v \in M_m\} \\ &= \{w \mid u - w \in M_m\} && \text{setting } w = u + v \\ &= \{w \mid d(u, w) \leq 1/m\}. \end{aligned}$$

Thus the  $B_{1/m}(u)$ 's are precisely the open balls in the pseudometric space induced by the pseudo-metric  $d$ .

## 7.5 Convergence, Cauchy Sequences, and Completion

Throughout this subsection, let  $M$  be an  $R$ -module and equip it with the topology induced by a  $Q$ -filtration  $(M_n)$  of  $M$ .

### 7.5.1 Basic Definitions

Since  $\tau(\mathcal{B})$  is a pseudo-metric space, it makes sense to talk about concepts like Cauchy sequences and completions.

**Definition 7.8.** Let  $(u_n)$  be a sequence of elements in  $M$ .

1. We say the sequence  $(u_n)$  converges to an element  $u \in M$  if for all  $k \in \mathbb{N}$  there exists  $N \in \mathbb{N}$  such that

$$n \geq N \text{ implies } u_n - u \in M_k.$$

In this case, we say  $(u_n)$  is a **convergent sequence** and that it **converges** to  $u$ . We denote this by  $u_n \rightarrow u$  as  $n \rightarrow \infty$ , or  $\lim_{n \rightarrow \infty} u_n = u$ , or even just  $u_n \rightarrow u$ .

2. We say the sequence  $(u_n)$  is **Cauchy** if for all  $k \in \mathbb{N}$  there exists  $N \in \mathbb{N}$  such that

$$n, m \geq N \text{ implies } u_m - u_n \in M_k.$$

The set of all Cauchy sequences in  $M$  will be denoted  $\mathfrak{C}_{(M_n)}(M)$ . The set of all Cauchy sequences which converge to 0 is denoted  $\mathfrak{C}_{(M_n)}^0(M)$ . If the  $Q$ -filtration  $(M_n)$  is understood from context, then we will drop  $(M_n)$  from the subscript and just write  $\mathfrak{C}(M)$  and  $\mathfrak{C}^0(M)$ .

3. We say  $M$  is **complete** if every Cauchy sequence in  $M$  is a convergent sequence in  $M$ .

### 7.5.2 Analytic Description of Completion

In analysis, one learns about how to construct a completion of a given metric space  $(X, d)$ . Let us briefly recall how this works. We define  $\mathfrak{C}(X)$  to be the set of all Cauchy sequences in  $X$ . The metric  $d$  on  $X$  induces a pseudometric  $\tilde{d}$  on  $\mathfrak{C}(X)$ , defined by

$$\tilde{d}((x_n), (y_n)) = \lim_{n \rightarrow \infty} d(x_n, y_n). \quad (45)$$

One shows that (44) is a well-defined pseudometric on  $\mathfrak{C}(X)$  and that  $\mathfrak{C}(X)$  is a complete pseudometric space. To get a genuine metric space, we put an equivalence relation on  $\mathfrak{C}(X)$ , namely we say  $(x_n) \sim (y_n)$  if and only if  $\tilde{d}((x_n), (y_n)) = 0$ . One then shows that the pseudometric  $\tilde{d}$  on  $\mathfrak{C}_X$  induces a genuine metric  $[\tilde{d}]$  on  $[\mathfrak{C}(X)] = \mathfrak{C}(X)/\sim$ . Finally one shows that  $([\mathfrak{C}(X)], [\tilde{d}])$  is a **completion** of  $(X, d)$ . This means that  $[\mathfrak{C}(X)]$  is complete and that the natural map  $\iota: X \rightarrow [\mathfrak{C}(X)]$  given by  $x \mapsto (\bar{x})$  is an isometric embedding with dense image. It can be shown that completions are unique up to a unique isometry which respects inclusion maps. Thus we typically refer to  $[\mathfrak{C}(X)]$  as *the* completion of  $X$ .

### 7.5.3 Algebraic Description of Completion

Returning to our setting, note that  $\mathfrak{C}^0(M)$  plays the role of the equivalence relation  $\sim$  above, namely  $(u_n) \sim (v_n)$  if and only if  $(u_n - v_n) \in \mathfrak{C}^0(M)$ . It is easy to then see that  $[\mathfrak{C}(M)] = \mathfrak{C}(M)/\mathfrak{C}^0(M)$  is the completion of  $M$ . In fact, we have more structure on  $[\mathfrak{C}(M)]$ . Indeed,  $\mathfrak{C}(M)$  is a  $R$ -module and  $\mathfrak{C}^0(M)$  is an  $R$ -submodule of  $\mathfrak{C}(M)$ , where addition and multiplication are defined pointwise. Thus we have an  $R$ -module structure on  $[\mathfrak{C}(M)]$ . Here's is a really nice description of  $[\mathfrak{C}(M)]$  as an  $R$ -module:

**Theorem 7.5.** We have an  $R$ -module isomorphism

$$[\mathfrak{C}(M)] \cong \varprojlim M/M_k.$$

*Proof.* We define  $\Phi: [\mathfrak{C}(M)] \rightarrow \varprojlim M/M_k$  as follows: let  $[(u_n)] \in [\mathfrak{C}(M)]$ , so  $(u_n)$  is a Cauchy sequence which represents the coset  $[(u_n)]$ . For each  $k \in \mathbb{N}$ , choose  $\pi(k) \in \mathbb{N}$  such that  $m, n \geq \pi(k)$  implies  $u_n - u_m \in M_k$ . In particular, this means  $m, n \geq \pi(k)$  implies  $\bar{u}_n = \bar{u}_m = \bar{u}_{\pi(k)}$  in  $M/M_k$ . Here we think of  $\pi: \mathbb{N} \rightarrow \mathbb{N}$  as a strictly increasing function and we refer to it as a **stabilizing function** for the Cauchy sequence  $(u_n)$ . We are now ready to define  $\Phi$ . We set

$$\Phi([(u_n)_{n \in \mathbb{N}}]) = (\bar{u}_{\pi(k)})_{k \in \mathbb{N}}. \quad (46)$$

Note that (45) really does land in  $\varprojlim M/M_k$  since  $\pi$  is a stabilizing function for the Cauchy sequence  $(u_n)$ . We need to check that (45) is well-defined since it clearly depends on many choices.

First, suppose  $\rho: \mathbb{N} \rightarrow \mathbb{N}$  is another stabilizing function for the Cauchy sequence  $(u_n)$ . So for each  $k \in \mathbb{N}$  we have  $m, n \geq \rho(k)$  implies  $\bar{u}_n = \bar{u}_m$  in  $M/M_k$ . Then choosing  $n \geq \max(\rho(k), \pi(k))$  would give us  $\bar{u}_{\pi(k)} = \bar{u}_n = \bar{u}_{\rho(k)}$  in  $M/M_k$ . Thus our construction of  $\Phi$  does not depend on the choice of a stabilizing function. Next,

suppose  $(u_n + \varepsilon_n)$  is another representative of the coset  $[(u_n)]$  where  $\varepsilon_n \rightarrow 0$ . For each  $k \in \mathbb{N}$ , choose  $\rho(k) \in \mathbb{N}$  such that  $n \geq \rho(k)$  implies  $\varepsilon_n \in M_k$ , and set  $\varrho = \max(\pi, \rho)$ . Then for each  $k \in \mathbb{N}$ , we have  $\bar{\varepsilon}_{\varrho(k)} = \bar{\varepsilon}_{\rho(k)} = 0$  and  $\bar{u}_{\varrho(k)} = \bar{u}_{\pi(k)}$  in  $M/M_k$ . Thus

$$(\bar{u}_{\varrho(k)} + \bar{\varepsilon}_{\varrho(k)}) = (\bar{u}_{\pi(k)}).$$

This shows us that  $\Phi$  does not depend on the choice of a representative of the coset  $[(u_n)]$ . All choice have been accounted for, and hence  $\Phi$  is well-defined.

Let us now check that  $\Phi$  is  $R$ -linear. Let  $a, b \in R$  and suppose  $[(u_n)], [(v_n)] \in [\mathfrak{C}(M)]$ . We can choose a common stabilizing function  $\pi: \mathbb{N} \rightarrow \mathbb{N}$  for the Cauchy sequences  $(u_n)$  and  $(v_n)$ , meaning for each  $k \in \mathbb{N}$  we have  $m, n \geq \pi(k)$  implies  $\bar{u}_n = \bar{u}_{\pi(k)}$  and  $\bar{v}_n = \bar{v}_{\pi(k)}$  in  $M/M_k$ . Then observe that  $\pi$  is a stabilizing function for the Cauchy sequence  $(au_n + bv_n)$ , hence

$$\begin{aligned} \Phi([(au_n + bv_n)]) &= (a\bar{u}_{\pi(k)} + b\bar{v}_{\pi(k)}) \\ &= a(\bar{u}_{\pi(k)}) + b(\bar{v}_{\pi(k)}) \\ &= a\Phi([u_n]) + b\Phi([v_n]). \end{aligned}$$

Let us now check that  $\Phi$  is surjective. Let  $(\bar{u}_k) \in \varprojlim M/M_k$ . So for each  $k \in \mathbb{N}$  we have  $n, m \geq k$  implies  $\bar{u}_n = \bar{u}_m$  in  $M/M_k$ . However this is precisely the same thing as saying  $(u_n)$  is a Cauchy sequence in  $M$  with the identity function  $1: \mathbb{N} \rightarrow \mathbb{N}$  being a stabilizing function for  $(u_n)$ . Thus  $\Phi([(u_n)]) = (\bar{u}_k)$ , and so we see that  $\Phi$  is surjective.

Finally, let us check that  $\Phi$  is injective. Suppose  $[(u_n)] \in \ker \Phi$ . Thus  $u_{\pi(k)} \in M_k$  for all  $k \in \mathbb{N}$ . In particular, we see that  $u_{\pi(n)} \rightarrow 0$  as  $n \rightarrow \infty$ . However  $(u_{\pi(n)})$  being a subsequence of the Cauchy sequence  $(u_n)$  forces  $u_n \rightarrow 0$  as  $n \rightarrow \infty$  as well. Thus  $[(u_n)] = 0$  in  $[\mathfrak{C}(M)]$ . It follows that  $\Phi$  is injective.  $\square$

Suppose  $(M'_n)$  is another  $Q$ -filtration of  $M$  such that  $(M_n) \geq (M'_n)$ . Thus there exists some  $d \in \mathbb{N}$  such that  $M'_n \supseteq M_{n+d}$  for all  $n \in \mathbb{Z}$ . An  $(M'_n)$ -Cauchy sequence is automatically an  $(M_n)$ -Cauchy sequence since the topology induced by  $(M_n)$  is *stronger* than the topology induced by  $(M'_n)$ . Thus we have an inclusion

$$\mathfrak{C}_{(M_n)}(M) \subseteq \mathfrak{C}_{(M'_n)}(M).$$

Furthermore, if a sequence converges to 0 in the  $(M_n)$ -topology, then it also converges to 0 in the weaker  $(M'_n)$ -topology. Thus we have an inclusion

$$\mathfrak{C}_{(M_n)}^0(M) \subseteq \mathfrak{C}_{(M'_n)}^0(M).$$

Thus we have a natural map

$$\Psi_{(M'_n), (M_n)}: [\mathfrak{C}_{(M_n)}(M)] \rightarrow [\mathfrak{C}_{(M'_n)}(M)].$$

Let us denote  $\Phi_{(M_n)}$  to be the isomorphism constructed in the proof of (7.5). The analogous isomorphism with respect to the  $Q$ -filtration  $(M'_n)$  is then denoted  $\Phi_{(M'_n)}$ .

On the other hand, since  $M_{n+d} \subseteq M'_n$  for all  $n \in \mathbb{N}$ , we have natural maps  $M/M_{n+d} \rightarrow M/M'_n$

**Proposition 7.11.** *With the notation above, we have a commutative diagram*

$$\begin{array}{ccc} [\mathfrak{C}_{(M'_n)}(M)] & \longrightarrow & \varprojlim M/M'_k \\ \uparrow & & \uparrow \\ [\mathfrak{C}_{(M_n)}(M)] & \longrightarrow & \varprojlim M/M_k \end{array}$$

*Proof.* Let  $[(u_n)] \in [\mathfrak{C}_{(M_n)}(M)]$ . Choose a stabilizing function  $\pi: \mathbb{N} \rightarrow \mathbb{N}$  for the  $(u_n)$  as an  $(M_n)$ -Cauchy sequence. Then observe that for each  $k \in \mathbb{N}$ , we have  $n \geq \pi(k+d)$  implies  $u_n \in M_{k+d} \subseteq M'_k$ . In particular, the function  $\pi_d: \mathbb{N} \rightarrow \mathbb{N}$ , defined by  $\pi_d(m) = \pi(d+m)$ , is a stabilizing function for  $(u_n)$  as an  $(M'_n)$ -Cauchy sequence. Thus

$$\Phi_{(M'_n)}([(u_n)]) = (\bar{u}_{\pi_d(k)}).$$

$\square$

It is natural to wonder if in fact we have  $\Phi_{(M_n)} = \Phi_{(M'_n)}$ . Then answer is yes! Indeed, let  $[(u_n)] \in [\mathfrak{C}(M)]$  and choose a stabilizing function  $\pi: \mathbb{N} \rightarrow \mathbb{N}$  for  $(u_n)$  with respect to  $\mathfrak{d}_{(M_n)}$ . Then for each  $k \in \mathbb{N}$  we have  $m, n \geq \pi(k+d)$  implies  $\bar{u}_n = \bar{u}_m$  in  $M/M_{k+d}$ , hence  $\bar{u}_n = \bar{u}_m$  in  $M/M'_k$  since  $M_{k+d} \subseteq M'_k$ . In particular, we see that

$$\Phi_{(M_n)}([(u_n)]) = (\bar{u}_{\pi(k)})$$

## 8 Modules of Finite Length

**Definition 8.1.** Let  $A$  be a ring and let  $M$  be an  $A$ -module.

1. Let  $\mathcal{C}(M)$  denote the set of all **chains of submodules** of  $M$ , that is,

$$\mathcal{C}(M) := \{ \mathcal{M} = (M = M_0 \supset M_1 \supset \cdots \supset M_n = 0) \mid M_i \neq M_{i+1} \}.$$

2. If  $\mathcal{M} = (M = M_0 \supset M_1 \supset \cdots \supset M_n = 0) \in \mathcal{C}(M)$ , then **length** $(\mathcal{M}) := n$ .
3. If  $\text{length}(M) < \infty$ , then we say  $M$  is **Artinian**. If  $A$  is Artinian as an  $A$ -module, then we say  $A$  is an **Artinian ring**.

*Remark.* The set  $\mathcal{C}(M)$  forms a poset in the following way: Given  $\mathcal{M}, \mathcal{M}' \in \mathcal{C}(M)$ , we say  $\mathcal{M}' \geq \mathcal{M}$  if we can obtain  $\mathcal{M}$  by removing some submodules in the chain  $\mathcal{M}'$ .

**Definition 8.2.** Let  $A$  be a ring,  $M$  an  $A$ -module, and  $\mathcal{M} := (M = M_0 \supset M_1 \supset \cdots \supset M_n = 0)$  a chain of submodules of  $M$ .

1. We say  $\mathcal{M}$  is a **composition series** for  $M$  if  $M_i/M_{i+1}$  is a nonzero simple module for each  $i$ .
2. We define the **length** of  $M$ , denoted  $\text{length}(M)$ , to be the least length of a composition series for  $M$ .

*Remark.*

1. If  $\mathcal{M}$  is not a composition series, then there exists some  $i$  such that  $M_i/M_{i+1}$  is not simple. Thus, there exists a nonzero proper submodule  $M'/M_{i+1}$  of  $M_i/M_{i+1}$ . Let  $\mathcal{M}'$  be the chain of submodules of  $M$  given by  $\mathcal{M}' = (M = M_0 \supset \cdots \supset M_i \supset M' \supset M_{i+1} \supset \cdots \supset M_n = 0)$ . Then  $\mathcal{M}' \geq \mathcal{M}$  and  $\text{length}(\mathcal{M}') = \text{length}(\mathcal{M}) + 1$ . So a composition series must be maximal with respect to the partial order.
2. A simple module must be generated by any nonzero element. Thus, if  $\mathcal{M}$  is a composition series, then each  $M_i/M_{i+1} \cong A/\mathfrak{p}$  for some maximal ideal  $\mathfrak{p}$ , which may be described by  $\mathfrak{p} = \text{Ann}(M_i/M_{i+1})$ .

**Theorem 8.1.** Let  $A$  be a ring, and let  $M$  be an  $A$ -module. Then  $M$  has a finite composition series if and only if  $M$  is Artinian and Noetherian. If  $M$  has a finite composition series  $\mathcal{M} := (M = M_0 \supset M_1 \supset \cdots \supset M_n = 0)$  of length  $n$ , then:

1. Every chain of submodules of  $M$  has length less than or equal to  $n$ , and can be refined to a composition series.
2. The sum of the localization maps  $M \rightarrow M_{\mathfrak{p}}$ , for  $\mathfrak{p}$  a prime ideal, gives an isomorphism of  $A$ -modules

$$M \cong \bigoplus_{\mathfrak{p}} M_{\mathfrak{p}},$$

where the sum is taken over all maximal ideals  $\mathfrak{p}$  such that some  $M_i/M_{i+1} \cong A/\mathfrak{p}$ . The number of  $M_i/M_{i+1}$  isomorphic to  $A/\mathfrak{p}$  is the length of  $M_{\mathfrak{p}}$  as an  $A_{\mathfrak{p}}$ -module, and is thus independent of the composition series chosen.

3. We have  $M = M_{\mathfrak{p}}$  if and only if  $M$  is annihilated by some power of  $\mathfrak{p}$ .

*Proof.* First suppose that  $M$  is Artinian and Noetherian, so that it satisfies both ascending chain condition and descending chain condition on submodules. By the ascending chain condition we may choose a maximal proper submodule  $M_1$ , a maximal proper submodule  $M_2$  of  $M_1$ , and so on. By the descending chain condition this sequence of submodules must terminate, and it can only terminate when some  $M_n = 0$ . In this case,  $M = M_0 \supset M_1 \supset \cdots \supset M_n = 0$  is a composition series for  $M$ .

1. Suppose  $N \subset M$  is a proper submodule. We shall show that  $\text{length}(N) < \text{length}(M)$ . The idea is simple: We intersect the terms of the given composition series for  $M$  with  $N$  and derive a shorter composition series for  $N$ . The quotient  $(N \cap M_i)/(N \cap M_{i+1})$  is isomorphic to

$$(N \cap M_i + M_{i+1})/M_{i+1} \subset M_i/M_{i+1}.$$

Since  $M_i/M_{i+1}$  is simple, we have either  $(N \cap M_i)/(N \cap M_{i+1}) = 0$  or else  $(N \cap M_i)/(N \cap M_{i+1})$  is simple and  $N \cap M_i + M_{i+1} = M_i$ . We claim that the latter possibility cannot happen for every  $i$ . Assuming on the contrary that it did, we prove by descending induction on  $i$  that  $N \supset M_i$  for every  $i$ , and we get a contradiction from the statement  $N \supset M_0 = M$ . If  $i = n$ , then clearly  $N \supset M_i$ . Supposing by induction

that  $N \supset M_{i+1}$ , we see that  $N \cap M_i = N \cap M_i + M_{i+1} = M_i$ , and it follows that  $N \supset M_i$ . From these facts, we see that the sequence of submodules

$$N \supset N \cap M_1 \supset \cdots \supset N \cap M_n = 0$$

can be changed, by leaving out the terms  $N \cap M_i$  such that  $N \cap M_i = N \cap M_{i+1}$ , to a composition series for  $N$  whose length is less than  $n$ . Since we could do this for any composition series for  $M$ , we get

$$\text{length}(N) < \text{length}(M).$$

Suppose now that  $M = N_0 \supset N_1 \supset \cdots \supset N_k$  is a chain of submodules. We shall show by induction on  $\text{length}(M)$  that  $k \leq \text{length}(M)$ . This is obvious if  $\text{length}(M) = 0$ , since then  $M = 0$ . By the argument above,  $\text{length}(N_1) < \text{length}(M)$ ; so by induction, the length of the chain  $N_1 \supset \cdots \supset N_k$  is  $k - 1 \leq \text{length}(N_1)$ . Since  $\text{length}(N_1) < \text{length}(M)$ , it follows that  $k \leq \text{length}(M)$ . From the definition of length, it now follows that every maximal chain of submodules has length  $n$ , and every chain of submodules can be refined to a maximal chain. Further,  $n$  is a uniform bound on the lengths of all ascending or descending chains of submodules, so that  $M$  has both ascending chain condition and descending chain condition.

2. It suffices to show that the given map becomes an isomorphism after localizing at any maximal ideal  $\mathfrak{q}$  of  $A$ . This will be easy once we understand what happens when we localize a module of finite length. We begin with the case when  $M$  has length 1, that is, when  $M$  is a simple module. In this case,  $M \cong A/\mathfrak{p}$  for some maximal ideal  $\mathfrak{p} = \text{Ann}(M)$ . If  $\mathfrak{p} = \mathfrak{q}$ , then since  $A/\mathfrak{q}$  is a field, the elements outside of  $\mathfrak{q}$  acts as units on  $A/\mathfrak{q}$ , and we see that  $(A/\mathfrak{q})_{\mathfrak{q}} = A/\mathfrak{q}$ . If on the other hand  $\mathfrak{p} \neq \mathfrak{q}$ , then since  $\mathfrak{p}$  is maximal,  $\mathfrak{p} \not\subset \mathfrak{q}$ , so  $\mathfrak{p}_{\mathfrak{q}} = A_{\mathfrak{q}}$ . Thus

$$(A/\mathfrak{p})_{\mathfrak{q}} = A_{\mathfrak{q}}/\mathfrak{p}_{\mathfrak{q}} = 0.$$

It follows in particular from this that if  $\mathfrak{q}$  and  $\mathfrak{q}'$  are distinct prime ideals, then  $(M_{\mathfrak{q}})_{\mathfrak{q}'} = 0$ . We now return to the general case, where  $\text{length}(M) = n < \infty$ . The composition series for  $M$  localizes to a sequence of submodules

$$M_{\mathfrak{q}} = (M_0)_{\mathfrak{q}} \supset (M_1)_{\mathfrak{q}} \supset \cdots \supset (M_n)_{\mathfrak{q}} = 0.$$

The modules  $M_i/M_{i+1}$  have length 1, so the case already treated shows that  $(M_i/M_{i+1})_{\mathfrak{q}} = M_i/M_{i+1}$  if  $\mathfrak{q} = \text{Ann}(M_i/M_{i+1})$  and  $(M_i/M_{i+1})_{\mathfrak{q}} = 0$  otherwise. Thus  $M_{\mathfrak{q}}$  has a finite composition series corresponding to the subseries of the one for  $M$ , obtained by keeping only those  $(M_i)_{\mathfrak{q}}$  such that  $M_i/M_{i+1} \cong A/\mathfrak{q}$ . In particular, if none of the modules  $M_i/M_{i+1}$  is isomorphic to  $A/\mathfrak{q}$ , then  $M_{\mathfrak{q}} = 0$ ; and if  $\mathfrak{q}$  and  $\mathfrak{q}'$  are distinct maximal ideals, then  $(M_{\mathfrak{q}})_{\mathfrak{q}'} = 0$ . Now consider the map

$$\alpha : M \rightarrow \bigoplus_{\mathfrak{p}} M_{\mathfrak{p}},$$

where the sum is taken over all maximal ideals  $\mathfrak{p}$  such that some  $M_i/M_{i+1} \cong A/\mathfrak{p}$ . We see from the above that we could harmlessly extend the sum to all maximal ideals; the new terms are all 0. For any maximal ideal  $\mathfrak{q}$  and any module  $M$ , we have  $(M_{\mathfrak{q}})_{\mathfrak{q}} = M_{\mathfrak{q}}$ , so the identity map is one part of the localization of  $\alpha$ :

$$\alpha_{\mathfrak{q}} : M_{\mathfrak{q}} \rightarrow \left( \bigoplus_{\mathfrak{p} \in \text{Max}(A)} M_{\mathfrak{p}} \right)_{\mathfrak{q}} = \bigoplus_{\mathfrak{p} \in \text{Max}(A)} (M_{\mathfrak{p}})_{\mathfrak{q}}.$$

But if  $\mathfrak{p} \neq \mathfrak{q}$  and  $M$  has finite length, then we have seen that  $(M_{\mathfrak{p}})_{\mathfrak{q}} = 0$ . Thus  $\alpha_{\mathfrak{q}}$  is the identity map for every maximal ideal  $\mathfrak{q}$ , and it follows that  $\alpha$  is an isomorphism.

3. Suppose that  $M$  is annihilated by a power of a maximal ideal  $\mathfrak{p}$ . If  $\mathfrak{q} \neq \mathfrak{p}$  is another maximal ideal, then  $\mathfrak{p}$  contains an element not in  $\mathfrak{q}$ . This element acts as a unit on  $M_{\mathfrak{q}}$ . Thus, by part 2,  $M \cong M_{\mathfrak{p}}$ . Conversely suppose that  $M \cong M_{\mathfrak{p}}$ . The preceding description of localization shows that every factor  $M_i/M_{i+1} \cong A/\mathfrak{p}$ . By induction, we see that  $\mathfrak{p}^d M \subset M_d$ , and in particular  $\mathfrak{p}^n M = 0$ .

□

**Example 8.1.** Let  $A = K[x, y]$ ,  $I = \langle x^3, x^2y, xy^2, y^3 \rangle$ , and  $M = A/I$ . We want to calculate the length of  $M$ . By Theorem (8.1), it suffices to find a composition series for  $M$  and calculate its length. A composition series for  $M$  is given by

$$0 = M_6 \subset M_5 \subset M_4 \subset M_3 \subset M_2 \subset M_1 \subset M_0 = M,$$

where

$$\begin{aligned} M_5 &= \langle x^2, xy^2, y^3 \rangle / I \\ M_4 &= \langle x^2, y^2 \rangle / I \\ M_3 &= \langle x^2, xy, y^2 \rangle / I \\ M_2 &= \langle x, y^2 \rangle / I \\ M_1 &= \langle x, y \rangle / I, \end{aligned}$$

and  $M_i / M_{i+1} \cong A / \langle x, y \rangle$  for all  $i$ . Thus,  $\text{length}(M) = 6$ .

## 9 Injective Modules

**Definition 9.1.** Let  $E$  be an  $R$ -module. We say  $E$  is **injective** if for every injective homomorphism  $\varphi: M \rightarrow N$  and for every homomorphism  $\psi: M \rightarrow E$  there exists a homomorphism  $\tilde{\psi}: N \rightarrow E$  such that  $\tilde{\psi} \circ \varphi = \psi$ . In this case, we say  $\tilde{\psi}$  **extends**  $\psi$  **along**  $\varphi$ . If  $\varphi$  is the inclusion map  $M \subset N$ , then we will simply say  $\tilde{\psi}$  **extends**  $\psi$ . We illustrate this with the following diagram:

$$\begin{array}{ccc} M & \xrightarrow{\varphi} & N \\ \psi \downarrow & \swarrow \tilde{\psi} & \\ E & & \end{array}$$

An equivalent definition of being injective is given in the following proposition:

**Proposition 9.1.** Let  $E$  be an  $R$ -module. Then  $E$  is injective if and only if the contravariant functor  $\text{Hom}_R(-, E)$  is exact.

*Proof.* Suppose that  $E$  is injective. Let

$$0 \longrightarrow M' \xrightarrow{\varphi} M \xrightarrow{\psi} M'' \longrightarrow 0$$

be an exact sequence of  $R$ -modules. Since  $\text{Hom}_R(-, E)$  is left exact, we only need to check that

$$\text{Hom}_R(M, E) \xrightarrow{\varphi^*} \text{Hom}_R(M', E) \longrightarrow 0$$

is exact at  $\text{Hom}_R(M', E)$ . This is equivalent to showing that  $\varphi^*$  is surjective. Let  $\lambda \in \text{Hom}_R(M', E)$ . Since  $E$  is injective, and  $\varphi: M' \rightarrow M$  is a monomorphism, there exists  $\tilde{\lambda} \in \text{Hom}_R(M', E)$  such that  $\varphi^*(\tilde{\lambda}) = \tilde{\lambda} \circ \varphi = \lambda$ . But  $\varphi^*(\tilde{\lambda}) = \tilde{\lambda} \circ \varphi$ , so  $\varphi^*$  is surjective. In fact, this map is surjective if and only if  $E$  is injective by definition.  $\square$

### 9.1 Baer's Criterion

Let  $E$  be an  $R$ -module. If we want to determine if  $E$  is injective, then it turns out that we do not necessarily need to check that the condition in Definition (9.1) holds for *every* injective homomorphism  $\varphi: M \rightarrow N$ ; we only need to check that it holds for every morphism of the type  $I \subset R$  where  $I$  is an ideal in  $R$ . This is called Baer's Criterion. Before we show this, let us first show that we need only consider inclusions  $M \subset N$ :

**Proposition 9.2.** Let  $E$  be an  $R$ -module. Then  $E$  is injective if and only if for every inclusion of  $R$ -modules  $M \subset N$  and for every homomorphism  $\psi: M \rightarrow E$  there exists a homomorphism  $\tilde{\psi}: N \rightarrow E$  such that  $\tilde{\psi}|_M = \psi$ .

*Proof.* One direction is obvious. To prove the other direction, let  $\varphi: M \rightarrow N$  be an injective homomorphism of  $R$ -modules and let  $\psi: M \rightarrow E$  be a homomorphism. Since  $\varphi$  is injective, it induces an isomorphism  $\varphi: M \rightarrow \varphi(M)$  of  $R$ -modules. Let  $\varphi^{-1}$  be the inverse homomorphism to this isomorphism. Then  $\varphi(M) \subset N$  and  $\psi \circ \varphi^{-1}: \varphi(M) \rightarrow E$  is a homomorphism, and so by hypothesis, there exists  $\tilde{\psi}: N \rightarrow E$  such that  $\tilde{\psi}|_{\varphi(M)} = \psi \circ \varphi^{-1}$ . This implies

$$\begin{aligned} \tilde{\psi} \circ \varphi &= \tilde{\psi}|_{\varphi(M)} \circ \varphi \\ &= \psi \circ \varphi^{-1} \circ \varphi \\ &= \psi. \end{aligned}$$

Therefore  $E$  is injective.  $\square$

Now we will state and prove Baer's Criterion:

## 9.2 Localization, Direct Sums, and Direct Products of Injective Modules

**Lemma 9.2.** *Let  $E$  an  $R$ -module, let  $\{E_\lambda\}_{\lambda \in \Lambda}$  be a collection of  $R$ -modules indexed by a set  $\Lambda$ , and let  $S$  be a multiplicatively closed subset of  $R$ . Then*

1.  $\prod_{\lambda \in \Lambda} E_\lambda$  is injective if and only if all the  $E_\lambda$  are injective.
2. If  $R$  is Noetherian, then  $\bigoplus_{\lambda \in \Lambda} E_\lambda$  is injective if and only if all the  $E_\lambda$  are injective.
3. If  $R$  is Noetherian and  $E$  is an injective, then  $E_S$  is an injective  $R_S$ -module.
4.  $E$  is injective if and only if any monomorphism  $\varphi: E \rightarrow M$  splits, that is, there exists a morphism  $\psi: M \rightarrow E$  such that  $\psi \circ \varphi = \text{id}_E$ .

*Proof.*

1. Since

$$\text{Hom}_R \left( M, \prod_{\lambda \in \Lambda} E_\lambda \right) \cong \prod_{\lambda \in \Lambda} \text{Hom}_R (M, E_\lambda)$$

for all  $R$ -modules  $M$ , the functor  $\text{Hom}_R (-, \prod_{\lambda \in \Lambda} E_\lambda)$  is exact if and only if the functors  $\text{Hom}_R (-, E_\lambda)$  are exact for all  $\lambda \in \Lambda$ .

2. First assume that  $\bigoplus_{\lambda \in \Lambda} E_\lambda$  is injective. Let  $\lambda \in \Lambda$ , let  $I$  be an ideal in  $R$ , and let  $\varphi: I \rightarrow E_\lambda$  be an  $R$ -module homomorphism. Since  $\bigoplus_{\lambda \in \Lambda} E_\lambda$  is injective, the composition

$$I \rightarrow E_\lambda \hookrightarrow \bigoplus_{\lambda \in \Lambda} E_\lambda$$

extends to a map  $\tilde{\varphi}: R \rightarrow \bigoplus_{\lambda \in \Lambda} E_\lambda$ . Letting  $\pi_\lambda: \bigoplus_{\lambda \in \Lambda} E_\lambda \rightarrow E_\lambda$  denote the projection to the  $\lambda$ th component, the map  $\pi_\lambda \circ \tilde{\varphi}$  extends  $\varphi$ . Thus  $E_\lambda$  is injective for all  $\lambda \in \Lambda$ . Note that this direction did not depend on the fact that  $R$  is Noetherian.

Conversely, assume each  $E_\lambda$  is injective. By Theorem (9.1), it is enough to show that for an ideal  $I$  of  $R$ , any homomorphism  $\varphi: I \rightarrow \bigoplus_{\lambda \in \Lambda} E_\lambda$  extends to  $R$ . Since  $R$  is Noetherian,  $I$  is finitely generated, and so there exists a finite subset  $\{\lambda_1, \dots, \lambda_n\}$  of  $\Lambda$  such that

$$\begin{aligned} \text{im } \varphi &\subseteq \bigoplus_{i=1}^n E_{\lambda_i} \\ &\cong \prod_{i=1}^n E_{\lambda_i}. \end{aligned}$$

From (1), we know that  $\prod_{i=1}^n E_{\lambda_i}$  is injective, and therefore we may extend  $\varphi$ . Thus  $\bigoplus_{\lambda \in \Lambda} E_\lambda$  is injective.

3. Let  $\varphi: I_S \rightarrow E_S$  be an  $R_S$ -module homomorphism. Since  $R$  is a Noetherian ring, the ideal  $I$  is finitely presented, and thus there exists  $\psi: I \rightarrow E$  such that  $\psi_S = \varphi$ . Since  $E$  is injective, we may choose an extension  $\tilde{\psi}: R \rightarrow E$  of  $\psi$ . Then  $\tilde{\psi}_S: R_S \rightarrow E_S$  is an extension of  $\varphi: I_S \rightarrow E_S$ .

4. One direction is obvious, so we only prove the nonobvious direction. Assume that any injective  $R$ -linear map out of  $E$  splits. Let  $\varphi: M \rightarrow N$  be an injective  $R$ -linear map and let  $\psi: M \rightarrow E$  be any  $R$ -linear map. We need to construct a map  $\tilde{\psi}: N \rightarrow E$  such that  $\tilde{\psi} \circ \varphi = \psi$ . To do this, consider the pushout module

$$E +_M N = (E \times N) / \{(\psi(u), -\varphi(u)) \mid u \in M\}$$

together its natural maps  $\iota_1: E \rightarrow E +_M N$  and  $\iota_2: N \rightarrow E +_M N$ , given by

$$\iota_1(v) = [v, 0] \quad \text{and} \quad \iota_2(w) = [0, w]$$

for all  $v \in E$  and  $w \in N$  where  $[v, w]$  denotes the equivalence class in  $E +_M N$  with  $(v, w)$  as one of its representatives. Observe that

$$\begin{aligned} \iota_1(\psi(u)) &= [\psi(u), 0] \\ &= [0, \varphi(u)] \\ &= \iota_2(\varphi(u)) \end{aligned}$$

for all  $u \in M$ . Therefore, we have a commutative diagram

$$\begin{array}{ccc} M & \xrightarrow{\varphi} & N \\ \psi \downarrow & & \downarrow \iota_2 \\ E & \xrightarrow{\iota_1} & E +_M N \end{array}$$

We claim that  $\iota_1$  is injective. Indeed, suppose  $v \in \ker \iota_1$ . Then  $[v, 0] = [0, 0]$  implies if  $(v, 0) = (\psi(u), -\varphi(u))$  for some  $u \in M$ . Then  $\varphi(u) = 0$  implies  $u = 0$  since  $\varphi$  is injective, and therefore

$$\begin{aligned} v &= \psi(u) \\ &= \psi(0) \\ &= 0. \end{aligned}$$

Thus  $\iota_1$  is injective. Therefore by hypothesis the map  $\iota_1: E \rightarrow E +_M N$  splits, say by  $\lambda: E +_M N \rightarrow E$ , where  $\lambda \circ \iota_1 = 1_E$ . Finally, we obtain a map  $\tilde{\psi}: N \rightarrow E$  by setting  $\tilde{\psi} := \lambda \circ \iota_2$ . Then

$$\begin{aligned} \tilde{\psi} \circ \varphi &= \lambda \circ \iota_2 \circ \varphi \\ &= \lambda \circ \iota_1 \circ \psi \\ &= \psi, \end{aligned}$$

shows that  $\tilde{\psi}$  has the desired property.  $\square$

**Proposition 9.3.** *Let  $R$  be a ring. Then  $R$  is Noetherian if and only if every direct sum of injective  $R$ -modules is injective.*

*Proof.* We proved one direction in Lemma (10.3). For the other direction, assume  $R$  is not Noetherian. Then  $R$  contains a strictly ascending chain of ideals

$$I_1 \subsetneq I_2 \subsetneq I_3 \subsetneq \cdots$$

Let  $I = \bigcup_j I_j$ . The natural maps

$$I \hookrightarrow R \rightarrow R/I_j \hookrightarrow E_R(R/I_j)$$

give us a homomorphism  $I \rightarrow \prod_j E_R(R/I_j)$ , whose image lies in the submodule  $\bigoplus_j E_R(R/I_j)$ . To see this, note for  $x \in I$ , we must have  $x \in I_k$  for some  $k$ . This implies the image of  $x$  lies in the submodule  $\bigoplus_{j=1}^{k-1} E_R(R/I_j)$ .

Therefore we have a homomorphism  $\varphi: I \rightarrow \bigoplus_j E_R(R/I_j)$ . But  $\varphi$  does not extend to a homomorphism  $R \rightarrow \bigoplus_j E_R(R/I_j)$ .  $\square$

**Proposition 9.4.** *Let  $R \rightarrow S$  be a flat ring map. If  $E$  is an injective as an  $S$ -module, then  $E$  is injective as an  $R$ -module.*

*Proof.* This is true because

$$\operatorname{Hom}_R(M, E) \cong \operatorname{Hom}_R(M \otimes_R S, E)$$

and the fact that tensoring with  $S$  is exact.  $\square$

**Proposition 9.5.** *Let  $R \rightarrow S$  be an epimorphism of rings. If  $E$  is an injective as an  $R$ -module, then  $E$  is injective as an  $S$ -module.*

*Proof.* This is true because

$$\operatorname{Hom}_R(N, E) = \operatorname{Hom}_S(N, E)$$

for any  $S$ -module  $N$ .  $\square$

## 9.3 Divisible Modules

**Definition 9.2.** Let  $M$  be an  $R$ -module. We say  $M$  is **divisible** if  $aM = M$  for every nonzerodivisor  $a \in R$ .

### 9.3.1 Image of divisible module is divisible

**Proposition 9.6.** *Let  $\varphi: M \twoheadrightarrow N$  be a surjective map of  $R$ -modules and suppose  $M$  is divisible. Then  $N$  is divisible.*

*Proof.* Let  $a \in R$  be a nonzerodivisor and let  $v \in N$ . We must find a  $v' \in N$  such that  $av' = v$ . It will then follow that  $aN = N$ , which will imply  $N$  is divisible. Since  $\varphi$  is surjective, we may choose a  $u \in M$  such that  $\varphi(u) = v$ . Since  $M$  is divisible, we may choose a  $u' \in M$  such that  $au' = u$ . Then setting  $v' = \varphi(u')$ , we have

$$\begin{aligned} av' &= a\varphi(u') \\ &= \varphi(au') \\ &= \varphi(u) \\ &= v. \end{aligned}$$

Thus  $N$  is divisible.  $\square$

### 9.3.2 Injectives modules are divisible (with converse being true in a PID)

**Proposition 9.7.** *Let  $M$  be an  $R$ -module. If  $M$  is injective, then  $M$  is divisible. The converse holds if  $R$  is a PID.*

*Proof.* Suppose  $M$  is injective and let  $a \in R$  be a nonzerodivisor. Then the map  $\varphi: M \rightarrow aM$ , given by

$$\varphi(u) = au$$

for all  $u \in M$  is an injective  $R$ -linear map. Thus we obtain a splitting map of  $\varphi$ , say  $\psi: aM \rightarrow M$ . Thus if  $u \in M$ , then we have

$$\begin{aligned} u &= (\psi\varphi)(u) \\ &= \psi(\varphi(u)) \\ &= \psi(au) \\ &= a\psi(u). \end{aligned}$$

This implies  $M = aM$ , that is,  $M$  is divisible.

For the converse direction, assume that  $R$  is a PID and that  $M$  is a divisible  $R$ -module. Let  $\varphi: \langle x \rangle \rightarrow M$  be a homomorphism, where  $\langle x \rangle$  is an ideal in  $R$ . Let  $a \in R$  be a nonzerodivisor and set  $u = \varphi(x)$ . Since  $M = xM$ , we have  $u = xv$  for some  $v \in M$ . Then the map  $\tilde{\varphi}: R \rightarrow M$ , given by

$$\tilde{\varphi}(a) = av$$

for all  $a \in R$ , extends  $\varphi$ . Indeed, it is clearly  $R$ -linear. Also

$$\begin{aligned} \tilde{\varphi}(bx) &= (bx)v \\ &= b(xv) \\ &= bu \\ &= b\varphi(x) \\ &= \varphi(bx) \end{aligned}$$

for all  $bx \in \langle x \rangle$ . It follows from Baer's Criterion that  $M$  is injective.  $\square$

**Example 9.1.** Since  $\mathbb{Z}$  is a PID and  $\mathbb{Q}/\mathbb{Z}$  is divisible as a  $\mathbb{Z}$ -module, Proposition (9.7) implies  $\mathbb{Q}/\mathbb{Z}$  is an injective  $\mathbb{Z}$ -module.

### 9.3.3 Decomposition of module over PID

**Proposition 9.8.** *Assume that  $R$  is a PID and let  $M$  be any  $R$ -module. Then  $M$  may be decomposed as  $M = D \oplus N$  where  $D$  is divisible and  $N$  has no nontrivial divisible subgroups.*

*Proof.* We first argue using Zorn's Lemma that  $M$  contains a maximal divisible submodule. Consider the partially ordered set  $(\mathcal{F}, \subseteq)$ , where  $\mathcal{F}$  is the family of all divisible submodules of  $M$ :

$$\mathcal{F} = \{D \subseteq M \mid D \text{ is divisible submodule of } M\},$$

and where the partial order  $\subseteq$  is set inclusion. Note that  $\mathcal{F}$  is nonempty since the zero module is divisible. Let  $\{D_i \mid i \in I\}$  be a totally ordered subset of  $\mathcal{F}$ . We claim that

$$\bigcup_{i \in I} D_i$$

is a divisible submodule of  $M$ , and hence an upper bound of  $\{D_i \mid i \in I\}$ .

To see this, we first show that  $\bigcup_{i \in I} D_i$  is a submodule of  $M$ . Indeed, it is nonempty since  $0 \in \bigcup_{i \in I} D_i$ . Also, if  $a \in R$  and  $u, v \in \bigcup_{i \in I} D_i$ , then there exists an  $i \in I$  such that  $u, v \in D_i$  since  $\{D_i \mid i \in I\}$  is totally ordered, and so

$$au + v \in D_i \subseteq \bigcup_{i \in I} D_i.$$

Thus  $\bigcup_{i \in I} D_i$  is a submodule of  $M$ .

Now we show that  $\bigcup_{i \in I} D_i$  is divisible. Let  $a$  be a nonzero divisor in  $R$  and let  $u$  be an element in  $\bigcup_{i \in I} D_i$ . Then there exists an  $i \in I$  such that  $u \in D_i$ , and as  $D_i$  is divisible, there exists a

$$v \in D_i \subseteq \bigcup_{i \in I} D_i$$

such that  $av = u$ . It follows that  $\bigcup_{i \in I} D_i$  is divisible.

Thus the conditions for Zorn's Lemma are satisfied and so there exists a maximal divisible submodule of  $M$ , say  $D \subseteq M$ . Since every divisible module over a PID is injective, we see that  $D$  is injective, and thus we have a direct sum decomposition of  $M$  say

$$M = D \oplus N$$

where  $N$  is a submodule of  $M$ . To finish the proof, assume for a contradiction that  $N$  has a nontrivial divisible submodule, say  $L \subseteq N$ . We claim that  $D + L$  is a divisible submodule of  $M$  which properly contains  $D$ . Indeed, it is divisible since if  $a \in R$  is a nonzerodivisor and  $x + y \in D + L$  where  $x \in D$  and  $y \in L$ , then we can choose  $u \in D$  and  $v \in L$  such that  $au = x$  and  $av = y$  since  $D$  and  $L$  are divisible, and so

$$\begin{aligned} a(u + v) &= au + av \\ &= x + y \end{aligned}$$

implies  $D + L$  is divisible. It also properly contains  $D$  since  $L \subseteq N$  is nontrivial. Thus  $D + L$  is a divisible submodule of  $M$  which properly contains  $D$ . This is a contradiction as  $D$  was chosen to be a maximal divisible submodule of  $M$ .  $\square$

**Proposition 9.9.** *Let  $A$  be an integral domain. Then its quotient field  $Q(A)$  is an injective  $A$ -module.*

*Proof.* We show this using Baer's criterion. Let  $\varphi : I \rightarrow Q(A)$  be an  $A$ -linear map where  $I$  is an ideal of  $A$ . If  $I = 0$ , extend by the zero map. Otherwise, let  $0 \neq x \in I$  and define the map  $\tilde{\varphi} : A \rightarrow Q(A)$  by  $a \mapsto a\varphi(x)/x$ . This map is obviously  $A$ -linear and if  $y \in I$ , then

$$\begin{aligned} \tilde{\varphi}(y) &= \frac{y\varphi(x)}{x} \\ &= \frac{\varphi(yx)}{x} \\ &= \frac{x\varphi(y)}{x} \\ &= \varphi(y). \end{aligned}$$

$\square$

**Lemma 9.3.** *Let  $S$  be an  $R$ -algebra, let  $E$  be an injective  $R$ -module, and let  $P$  a projective  $S$ -module. Then  $\text{Hom}_R(P, E)$  is an injective  $S$ -module.*

*Proof.* The functor  $\text{Hom}_S(-, \text{Hom}_R(P, E))$  is exact if and only if the functor  $\text{Hom}_R(- \otimes_S P, E)$  is exact, but tensor-hom adjunction. Now notice that the functor  $- \otimes_S P$  is exact since  $P$  is projective (and hence flat), and the functor  $\text{Hom}_R(-, E)$  is exact since  $E$  is injective. Thus  $\text{Hom}_R(- \otimes_S P, E)$  is a composition of exact functors, and so it must be exact too.  $\square$

## 9.4 Injective Hulls

We will now prove that any  $R$ -module  $M$  can be embedded into an injective module. We first prove this for  $R = \mathbb{Z}$ .

**Lemma 9.4.** *Let  $M$  be a  $\mathbb{Z}$ -module. Then there exists an injective module  $E$  and a monomorphism  $\varphi : M \rightarrow E$ .*

*Proof.* Recall that  $\mathbb{Q}/\mathbb{Z}$  is injective. For a  $\mathbb{Z}$ -module  $N$ , define

$$N^\vee := \text{Hom}_{\mathbb{Z}}(N, \mathbb{Q}/\mathbb{Z}).$$

We now have a natural map  $M \rightarrow M^{\vee\vee}$ , denoted by  $u \mapsto \hat{u}$ , where

$$\hat{u}(\varphi) = \varphi(u)$$

for all  $u \in M$  and  $\varphi \in \text{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})$ . We claim that the map  $M \rightarrow M^{\vee\vee}$  is a monomorphism. Indeed, suppose  $u \in M$  with  $\varphi(u) \neq 0$ . Denote  $n := \text{ord}(u)$  (so  $nu = 0$  with  $n$  being as small as possible) and let  $\varphi : \langle u \rangle \rightarrow \mathbb{Q}/\mathbb{Z}$  be the unique homomorphism such that  $\varphi(u) = [1/n]$ . Then  $\varphi$  is not the zero map. Since  $\mathbb{Q}/\mathbb{Z}$  is injective, we can extend  $\varphi$  to a nonzero map  $\tilde{\varphi} : M \rightarrow \mathbb{Q}/\mathbb{Z}$ . Then

$$\begin{aligned} \hat{u}(\tilde{\varphi}) &= \tilde{\varphi}(\hat{u}) \\ &= \varphi(u) \\ &\neq 0 \end{aligned}$$

implies  $\hat{u} \neq 0$ .

Now let  $\bigoplus_{\lambda \in \Lambda} \mathbb{Z} \rightarrow M^\vee$  be a surjection. Since the contravariant functor  $\text{Hom}_{\mathbb{Z}}(-, \mathbb{Q}/\mathbb{Z})$  is left exact, we get an embedding

$$\begin{aligned} M &\rightarrow M^{\vee\vee} \\ &= \text{Hom}_{\mathbb{Z}}(M^\vee, \mathbb{Q}/\mathbb{Z}) \\ &\rightarrow \text{Hom}_{\mathbb{Z}}\left(\bigoplus_{\lambda \in \Lambda} \mathbb{Z}, \mathbb{Q}/\mathbb{Z}\right) \\ &\cong \prod_{\lambda \in \Lambda} \mathbb{Q}/\mathbb{Z}, \end{aligned}$$

where  $\prod_{\lambda \in \Lambda} \mathbb{Q}/\mathbb{Z}$  is injective by Lemma (10.3). □

Now we prove it for an arbitrary commutative ring.

**Theorem 9.5.** *Let  $M$  be an  $R$ -module. Then there is an injective module  $E$  and a monomorphism  $\varphi: M \rightarrow E$ .*

*Proof.* First we consider  $M$  as a  $\mathbb{Z}$ -module. Then there exists a  $\mathbb{Z}$ -injective module  $E_1$  such that we have a monomorphism  $\varphi_1: M \rightarrow E_1$ , by Lemma (9.4). Since  $R$  is projective over itself,  $\text{Hom}_{\mathbb{Z}}(R, E_1)$  is injective as an  $R$ -module, by Lemma (9.3). Let  $\Psi: M \rightarrow \text{Hom}_{\mathbb{Z}}(R, E_1)$  be given by

$$\Psi(u)(a) = \varphi_1(au)$$

for all  $a \in R$  and  $u \in M$ . Then  $\Psi$  is  $R$ -linear and injective. Indeed, it is  $R$ -linear since  $\varphi_1$  is  $\mathbb{Z}$ -linear. Also, it is injective since if  $\Psi(u) = 0$ , then

$$\begin{aligned} 0 &= \Psi(u)(1) \\ &= \varphi_1(u), \end{aligned}$$

which implies  $u = 0$  since  $\varphi_1$  is injective. □

## 9.5 Essential Extensions

**Definition 9.3.** Let  $M \subset E$  be an inclusion of  $R$ -modules. We say  $E$  is an **essential extension** of  $M$ , denoted  $M \subseteq_e E$ , if every nonzero submodule of  $E$  intersects  $M$  nontrivially, that is, if  $N$  is a nonzero submodule of  $E$ , then  $N \cap M \neq 0$ . Such an essential extension is called **maximal**, denoted  $M \subseteq_m E$  if no module properly containing  $E$  is an essential extension of  $M$ , that is, we say  $E$  is maximal if  $E \subset F$  where the inclusion is strict, then there exists a submodule  $N \subset F$  such that  $N \cap M = 0$ .

**Proposition 9.10.** *Let  $M, E, E_1$ , and  $E_2$  be  $R$ -modules*

1. *Suppose  $M \subset E_1$  and  $M \subseteq_e E_2$ . Then  $E_1 \subseteq_e E_2$ .*
2. *Suppose  $M \subseteq_e E_1$  and  $E_1 \subseteq_e E_2$ . Then  $M \subseteq_e E_2$ .*
3.  *$E$  is an essential extension of  $M$  if and only if for any nonzero  $u \in E$ , we have  $\langle u \rangle \cap M \neq 0$ .*

*Proof.* 1. Let  $N$  be a nonzero submodule of  $E_2$ . Since  $M \subseteq_e E_2$ , we have  $N \cap M \neq 0$ . Then since  $M \subset E_1$ , we have

$$\begin{aligned} E_1 \cap N &\supset M \cap N \\ &\neq 0. \end{aligned}$$

It follows that  $E_1 \subseteq_e E_2$ .

2. Let  $N$  be a nonzero submodule of  $E_2$ . Since  $E_1 \subseteq_e E_2$ , we have  $N \cap E_1 \neq 0$ . Since  $N \cap E_1$  is a nonzero submodule of  $E_1$  and  $M \subseteq_e E_1$ , we have

$$\begin{aligned} M \cap N &= (M \cap E_1) \cap N \\ &= M \cap (E_1 \cap N) \\ &\neq 0. \end{aligned}$$

It follows that  $M \subseteq_e E_2$ .

3. One direction is obvious, so suppose we have  $\langle u \rangle \cap M \neq 0$  for all  $u \in E$  and let  $N$  be a nonzero submodule of  $E$ . Choose a nonzero element  $w \in N$ . Then

$$\begin{aligned} N \cap M &\supset \langle w \rangle \cap M \\ &\neq 0. \end{aligned}$$

□

**Example 9.2.** Let  $I$  be an ideal in  $R$ . Then

$$0 :_M I \subseteq_e \bigcup_{n=1}^{\infty} 0 :_M I^n.$$

Indeed, let  $u$  be a nonzero element in  $\bigcup_{n=1}^{\infty} 0 :_M I^n$ . Choose  $n$  is the smallest natural number such that  $um^n = 0$ . Then

$$\begin{aligned} 0 &\neq um^{n-1} \\ &\subset \langle u \rangle \cap (0 :_M \mathfrak{m}). \end{aligned}$$

**Example 9.3.** Consider the formal power series ring  $R = K[[x]]$  where  $K$  is field and let  $M = R_x/R$ . Every element of  $M$  is killed by a power of the maximal ideal, hence

$$M = \bigcup_{n=1}^{\infty} 0 :_M \mathfrak{m}^n.$$

The **socle** of  $M$  is defined to be  $\text{soc } M := 0 :_M \mathfrak{m}$ . Thus by the previous example, we have  $\text{soc } M \subseteq_e M$ . It is easy to see that  $\text{soc } M$  is the 1-dimensional  $\mathbb{C}$ -vector space generated by  $[1/x]$ , that is, the image of  $1/x$  in  $M$ . On the other hand,

$$\prod_{\mathbb{N}} \text{soc } M \subset \prod_{\mathbb{N}} M$$

is not an essential extension since the element

$$([1/x^n]) \in \prod_{\mathbb{N}} M$$

does not have a nonzero multiple in  $\prod_{\mathbb{N}} \text{soc } M$ .

### 9.5.1 Injective Modules are Modules with no Proper Essential Extensions

**Lemma 9.6.** Let  $M$  be an  $R$ -module. Then  $M$  is an injective  $R$ -module if and only if  $M$  has no proper essential extensions.

*Proof.* Suppose that  $M$  is injective and let  $M \subseteq_e E$  be an essential extension. Since  $M \subset E$  and  $M$  is injective, we see that  $M$  is a direct summand of  $E$ , that is  $E = M \oplus N$  for some submodule  $N \subset E$ . Then  $M \cap N = 0$  implies  $N = 0$ , hence  $M = E$ .

Conversely, suppose that  $M$  has no proper essential extension. Embed  $M$  into an injective module  $E$  and let  $N$  be a maximal submodule of  $E$  such that  $M \cap N = 0$  (Zorn). Then  $E/N$  is an essential extension of  $M$  by construction, hence  $M = E/N$ , and therefore  $E = M \oplus N$ . Then  $M$  is injective since  $E$  is injective, by Lemma (10.3).  $\square$

**Lemma 9.7.** Let  $A$  be a ring and let  $M$  be an  $A$ -module. Then  $M$  has a maximal essential extension.

*Proof.* Embed  $M$  into an injective  $A$ -module  $E$ . We claim that there are maximal essential extensions of  $M$  in  $E$ . We order the set of essential extensions of  $M$  in  $E$  by inclusion. The union of a chain of essential extensions is again essential. Therefore, there exists a maximal essential extension by Zorn's lemma. We claim that such an extension is a maximal essential extension in general. Let  $N$  be such a maximal essential extension inside  $E$  and suppose that  $N'$  is an essential extension of  $N$ , where  $N'$  is not necessarily contained in  $E$ . Since  $N \rightarrow N'$  is an inclusion, and  $E$  is injective, we can extend the inclusion  $N \rightarrow E$  to a map  $\varphi : N' \rightarrow E$ . Since  $\text{Ker}(\varphi) \cap M = 0$  by construction, it follows that  $\varphi$  is injective, but this contradicts the maximality of  $N$  inside  $E$ .  $\square$

**Theorem 9.8.** Let  $A$  be a ring and  $M \subset E$  and inclusion of  $A$ -modules. The following are equivalent:

1.  $E$  is a maximal essential exentsion of  $M$ .
2.  $E$  is injective, and is essential over  $M$ .
3.  $E$  is minimal injective over  $M$ .

*Proof.*

(1  $\implies$  2): Follows from Remark (??) and Lemma (9.6)

(2  $\implies$  3): Suppose that  $E'$  is an injective  $A$ -module such that  $M \subset E' \subset E$ . Then the map  $E' \subset E$  splits, so  $E = E' \oplus N$  for some  $A$ -module  $N \subset E$ . Since  $M \subset E'$ , we have  $M' \cap N = 0$ . This implies  $N = 0$  since  $E$  is essential over  $M$ .

(3  $\implies$  1): From the proof of Lemma (9.7), it follows that there is a maximal essential extension  $E'$  of  $M$  contained in  $E$ . By (1  $\implies$  2), we see that  $E'$  is injective. Since  $E$  was a minimal injective module containing  $M$ , we have  $E = E'$ .  $\square$

**Definition 9.4.** If  $M \subset E$  satisfies any of the equivalent properties of Theorem (9.8), then  $E$  is called an **injective hull** of  $M$ .

**Lemma 9.9.** Let  $E$  and  $E'$  be injective hulls of  $M$ . Then there exists an isomorphism  $\varphi : E \rightarrow E'$  which is the identity on  $M$ .

*Proof.* The map  $M \rightarrow E'$  can be extended, by injectivity of  $E$ , to a map  $\varphi : E \rightarrow E'$ . The map is identity on  $M$  and as before since  $\text{Ker}(\varphi) \cap M = 0$ , it follows by essentiality that  $\varphi$  is injective. Since  $E'$  was minimal injective, it follows that  $\varphi$  is surjective as well.  $\square$

We use the notation  $E(M)$  to denote the injective hull of  $M$ , which by the previous lemma, is well-defined up to an isomorphism that fixes  $M$ .

**Lemma 9.10.**

1. If  $E$  is an injective module containing  $M$ , then  $E$  contains a copy of  $E(M)$ .
2. If  $N \supset_e M$ , then  $N$  can be enlarged to a copy of  $E(M)$  and  $E(M) = E(N)$ .

*Proof.*

1. We know that there is a maximal essential extension of  $M$  contained in  $E$ .
2. A maximal essential extension of  $N$  is a maximal essential extension of  $M$ .

$\square$

**Lemma 9.11.** Let  $A$  be a ring,  $M_i \subset E_i$  for all  $i \in I$  be  $A$ -modules over  $A$ . Then

$$\bigoplus_{i \in I} M_i \subset_e \bigoplus_{i \in I} E_i \quad \text{if and only if} \quad M_i \subset_e E_i$$

for all  $i \in I$ .

**Lemma 9.12.** Let  $A$  be a ring and let  $M_1, \dots, M_n$  be  $A$ -modules. Then

$$E \left( \bigoplus_{i=1}^n M_i \right) = \bigoplus_{i=1}^n E(M_i).$$

## 9.6 Injective Resolutions and Injective Dimension

**Definition 9.5.** Let  $A$  be a ring and  $M$  an  $A$ -module. We say that a complex of injective  $A$ -modules

$$\mathcal{E} : E_0 \xrightarrow{\varphi_1} E_1 \xrightarrow{\varphi_2} E_2 \longrightarrow \dots$$

is an **injective resolution** of  $M$  if  $\text{Ker}(\psi_1) = M$  and  $\mathcal{E}$  is exact except at  $E_0$ . If  $\mathcal{E}$  is an injective resolution, then we say that  $\mathcal{E}$  is a **minimal injective resolution** if and only if each  $E_n$  is the injective hull of  $\text{Ker}(\psi_{n+1})$ . Every module has a minimal injective resolution, which is unique up to isomorphism. The **injective dimension** of  $M$ , denoted  $\text{id}_A(M)$ , is the length of this resolution (which may be  $\infty$ ).

**Proposition 9.11.** Let  $A$  be a Noetherian ring,  $M$  an  $A$ -module, and  $S$  a multiplicatively closed set. Then

$$\text{id}_{A_S}(M_S) \leq \text{id}_A(M).$$

*Proof.* This follows from exactness of localization and Lemma (10.3).  $\square$

**Proposition 9.12.** Let  $A$  be a ring and  $M$  an  $A$ -module. The following conditions are equivalent

1.  $\text{id}(M) \leq n$ ;
2.  $\text{Ext}_A^{n+1}(N, M) = 0$  for all  $A$ -modules  $N$ ;
3.  $\text{Ext}_A^{n+1}(A/I, M) = 0$  for all ideals  $I$  of  $A$ .

*Proof.*

1  $\implies$  2 follows from the fact that  $\text{Ext}_A^{n+1}(N, M)$  can be computed from an injective resolution of  $M$ .

2  $\implies$  3 is trivial.

3  $\implies$  1: Let

$$0 \rightarrow M \rightarrow E^0 \rightarrow E^1 \rightarrow E^2 \rightarrow \cdots \rightarrow E^{n-1} \rightarrow C \rightarrow 0$$

be an exact sequence, where the modules  $E^j$  are injective. From the fact that  $\text{Ext}_A^i(A/I, E) = 0$  for  $i > 0$  if  $E$  is an injective  $A$ -module, the above exact sequence yields the isomorphism

$$\text{Ext}_A^1(A/I, C) \cong \text{Ext}_A^{n+1}(A/I, M),$$

and so  $\text{Ext}_A^1(A/I, C) = 0$  for all ideals  $I$  of  $A$ . It follows that  $C$  is injective from Remark (9.1).  $\square$

We can sharpen Proposition (9.12) if  $A$  is a Noetherian ring. We first observe:

**Lemma 9.13.** *Let  $A$  be a Noetherian ring,  $M$  an  $A$ -module,  $N$  a finitely generated  $A$ -module, and  $n > 0$  an integer. Suppose that  $\text{Ext}_A^n(A/\mathfrak{p}, M) = 0$  for all  $\mathfrak{p} \in \text{Supp}(N)$ . Then  $\text{Ext}_A^n(N, M) = 0$ .*

*Proof.*  $N$  has a finite filtration whose factors are isomorphic to  $A/\mathfrak{p}$  for certain  $\mathfrak{p} \in \text{Supp}(N)$ . Hence the lemma follows from the additivity of the vanish of  $\text{Ext}_A^n(-, M)$ .  $\square$

**Corollary.** *Let  $A$  be a Noetherian ring and  $M$  an  $A$ -module. The following are equivalent:*

1.  $\text{id}_A(M) \leq n$ ;
2.  $\text{Ext}_A^{n+1}(A/\mathfrak{p}, M) = 0$  for all  $\mathfrak{p} \in \text{Spec}(A)$ .

**Proposition 9.13.** *Let  $(A, \mathfrak{m}, k)$  be a Noetherian local ring,  $\mathfrak{p}$  a prime ideal different from  $\mathfrak{m}$ , and  $M$  a finitely generated  $A$ -module. If  $\text{Ext}_A^{n+1}(A/\mathfrak{q}, M) = 0$  for all prime ideals  $\mathfrak{q} \in \mathbf{V}(\mathfrak{p})$ , with  $\mathfrak{q} \neq \mathfrak{p}$ , then  $\text{Ext}_A^n(A/\mathfrak{p}, M) = 0$ .*

*Proof.* We choose an element  $x \in \mathfrak{m} \setminus \mathfrak{p}$ . The element  $x$  is  $(A/\mathfrak{p})$ -regular, and therefore we get the exact sequence

$$0 \longrightarrow A/\mathfrak{p} \xrightarrow{\cdot x} A/\mathfrak{p} \longrightarrow A/\langle x, \mathfrak{p} \rangle \longrightarrow 0$$

which induces the exact sequence

$$\text{Ext}_A^n(A/\mathfrak{p}, M) \xrightarrow{\cdot x} \text{Ext}_A^n(A/\mathfrak{p}, M) \longrightarrow \text{Ext}_A^{n+1}(A/\langle x, \mathfrak{p} \rangle, M).$$

Since  $\mathbf{V}(x, \mathfrak{p}) \subset \{\mathfrak{q} \in \mathbf{V}(\mathfrak{p}) \mid \mathfrak{q} \neq \mathfrak{p}\}$ , Lemma (9.13) and our assumption imply

$$\text{Ext}_A^{n+1}(A/\langle x, \mathfrak{p} \rangle, M) = 0,$$

so that multiplication by  $x$  on the finitely generated  $A$ -module  $\text{Ext}_A^n(A/\mathfrak{p}, M)$  is a surjective homomorphism. The desired result follows from Nakayama's lemma.  $\square$

It is now easy to derive the following useful formula for the injective dimension of a finitely generated module.

**Proposition 9.14.** *Let  $(A, \mathfrak{m}, k)$  be a Noetherian local ring, and  $M$  a finitely generated  $A$ -module. Then*

$$\text{id}_A(M) = \sup\{i \mid \text{Ext}_A^i(k, M) \neq 0\}.$$

*Proof.* We set  $t = \sup\{i \mid \text{Ext}_A^i(k, M) \neq 0\}$ . It is clear that  $\text{id}_A(M) \geq t$ . To prove the converse inequality, note that the repeated application of Proposition (9.13) yields  $\text{Ext}_A^i(A/\mathfrak{p}, M) = 0$  for all  $\mathfrak{p} \in \text{Spec}(A)$  and all  $i > t$ . This implies  $\text{id}_A(M) \leq t$ .  $\square$

*Remark.* To see how the repeated application of Proposition (9.13) yields  $\text{Ext}_A^i(A/\mathfrak{p}, M) = 0$  for all  $\mathfrak{p} \in \text{Spec}(A)$  and all  $i > t$ , suppose  $\mathfrak{p}$  has dimension 1. Thus,  $\mathbf{V}(\mathfrak{p}) = \{\mathfrak{m}\}$ . Then  $\text{Ext}_A^{t+1}(A/\mathfrak{m}, M) = 0$  implies  $\text{Ext}_A^t(A/\mathfrak{p}, M) = 0$  and  $\text{Ext}_A^{t+2}(A/\mathfrak{m}, M) = 0$  implies  $\text{Ext}_A^{t+1}(A/\mathfrak{p}, M) = 0$ . Next, suppose  $\mathfrak{q}$  has dimension 2. Then for all primes  $\mathfrak{p} \in \mathbf{V}(\mathfrak{q})$  where  $\mathfrak{q} \neq \mathfrak{p}$ , we've just shown that  $\text{Ext}_A^{t+1}(A/\mathfrak{p}, M) = 0$ , and this implies  $\text{Ext}_A^t(A/\mathfrak{q}, M) = 0$ .

**Proposition 9.15.** *Let  $A$  be a ring,  $M$  be an  $A$ -module,  $x \in A$  be an  $A$ -regular and  $M$ -regular element, and*

$$\mathcal{E} : E_0 \xrightarrow{\varphi_1} E_1 \xrightarrow{\varphi_2} E_2 \longrightarrow \cdots$$

*be a minimal injective resolution of  $M$ . Set  $E'_i := \text{Hom}_A(A/x, E_i) \cong \{m \in E_i \mid xm = 0\}$ . The complex*

$$\mathcal{E}' : E'_1 \xrightarrow{\varphi_2} E'_2 \xrightarrow{\varphi_3} E'_3 \longrightarrow \cdots$$

is a minimal injective resolution of  $M/xM$  over  $A/x$ . Thus,

$$\text{id}_{A/x}(M/xM) = \text{id}_A(M) - 1.$$

and if  $N$  is an  $A$ -module annihilated by  $x$ , then

$$\text{Ext}_A^{i+1}(N, M) \cong \text{Ext}_{A/x}^i(N, M/xM)$$

for all  $i \geq 0$ .

*Proof.* Lemma (9.3) tells us that  $E'_i$  are injective  $(A/x)$ -modules. The homology of the complex

$$\text{Hom}_A(A/x, \mathcal{E}) : E'_0 \xrightarrow{\varphi_1} E'_1 \xrightarrow{\varphi_2} E'_2 \xrightarrow{\varphi_3} E'_3 \longrightarrow \cdots$$

is by definition  $\text{Ext}_A^*(A/x, M)$ . On the other hand,  $M$  is an essential submodule of  $E_0$ , and  $M$  contains no submodule annihilated by  $x$ , so  $E_0$  contains no submodule annihilated by  $x$ . Thus  $E'_0 = 0$ , and we see that  $\text{Hom}_A(A/x, \mathcal{E}) = \mathcal{E}'$ .

Computing  $\text{Ext}_A^*(A/x, M)$  instead from the free resolution

$$0 \longrightarrow A \xrightarrow{\cdot x} A \longrightarrow A/x \longrightarrow 0,$$

we see that  $\text{Ext}_A^1(A/x, M) = M/xM$  while  $\text{Ext}_A^i(A/x, M) = 0$  for  $i \neq 1$ . Thus,  $\mathcal{E}'$  is an injective resolution of  $M/xM$ . Note that the numbering of the terms of  $\mathcal{E}'$  is such that  $\text{Ext}_{A/x}^i(N, M/xM)$  is the homology of  $\text{Hom}_{A/x}(N, \mathcal{E}')$  at  $\text{Hom}_{A/x}(N, E'_{j+1})$ ; strictly speaking, we should say that  $\mathcal{E}'[1]$  is an injective resolution of  $M/xM$ .

To see that  $\mathcal{E}'$  is minimal, note that  $\text{Ker}(\varphi_{n+1} : E'_n \rightarrow E'_{n+1})$  is the intersection of the essential submodule  $\text{Ker}(\varphi_{n+1} : E_n \rightarrow E_{n+1})$  with  $E'_n$ , and is thus essential in  $E'_n$ . It follows at once that  $\text{id}_{A/x}(M/xM) = \text{id}_A(M) - 1$ . If  $x$  annihilates the  $A$ -module  $N$ , then every map from  $N$  to an  $E_i$  has image killed by  $x$ , so

$$\text{Hom}_A(N, \mathcal{E}) = \text{Hom}_A(N, \mathcal{E}') = \text{Hom}_{A/x}(N, \mathcal{E}').$$

Taking homology, and taking into account the shift in numbering, we get the last statement of the proposition.  $\square$

*Remark.* Recall that if  $(A, \mathfrak{m})$  is a local ring,  $M$  is an  $A$ -module, and  $x \in \mathfrak{m}$  is  $A$ -regular and  $M$ -regular, then  $\text{pd}_{A/x}(M/xM) = \text{pd}_A(M)$ . The idea behind that proof was to start with a minimal projective resolution of  $M$ ,

$$\mathcal{P} : \cdots \longrightarrow P_2 \xrightarrow{\varphi_2} P_1 \xrightarrow{\varphi_1} P_0$$

and show that the sequence

$$\mathcal{P} \otimes (A/x) : \cdots \longrightarrow P_2/xP_2 \xrightarrow{\bar{\varphi}_2} P_1/xP_1 \xrightarrow{\bar{\varphi}_1} P_0/xP_0$$

was a minimal projective resolution of  $M/xM$ .

To exploit this result, we need to know the modules of finite injective dimension over a zero-dimensional ring.

**Proposition 9.16.** *Let  $A$  be a local Cohen-Macaulay ring. If  $M$  is a maximal Cohen-Macaulay module of finite injective dimension, then  $\text{id}_A(M) = \dim(A)$ . If  $\dim(A) = 0$ , then  $M$  is a direct sum of copies of  $\omega_A$ , and  $M \cong \omega_A$  if and only if  $\text{End}_A(M) = A$ .*

*Proof.* Suppose first that  $\dim(A) = 0$ . Let  $D = \text{Hom}_A(-, \omega_A)$  be the dualizing functor. If  $M$  has finite injective dimension, then applying  $D$  to an injective resolution of  $M$  we see that  $D(M)$  is a module of finite projective dimension, and is thus free by the Auslander-Buchsbaum formula. Applying  $D$  again we see that  $M = D^2M$  is a direct sum of copies of  $D(A) = \omega_A$ . Using  $D$ , we see that the endomorphism ring of  $\omega_A^n$  is the same as the endomorphism ring of  $A^n$ . Thus it is equal to  $A$  if and only if  $n = 1$ .

If  $\dim(A) = d$  is arbitrary, then we may choose a regular sequence  $x_1, \dots, x_d$  of  $A$  that is a regular sequence on  $M$ , and use Proposition (9.15) to conclude that

$$\begin{aligned} \text{id}_A(M) &= d + \text{id}_{A/\langle x_1, \dots, x_d \rangle}(M/\langle x_1, \dots, x_d \rangle M) \\ &= d + 0 \\ &= d. \end{aligned}$$

$\square$

## 9.7 Injective Modules over Noetherian Rings

**Lemma 9.14.** *Let  $A$  be a Noetherian ring,  $S \subset A$  a multiplicatively closed set and  $M$  an  $A$ -module. Then  $E_A(M)_S \cong E_{A_S}(M_S)$ .*

*Proof.* We show that  $E_A(M)_S$  is an injective hull of the  $A_S$ -module  $M_S$ . We know from Lemma (10.3) that  $E_A(M)_S$  is an injective  $A_S$ -module. It remains to be show that  $E_A(M)_S$  is an essential extension of  $M_S$ . Choose  $e/s \in E_A(M)_S$ , where  $e \in E_A(M)$  and  $s \in S$ . We want to show that  $A_S(e/s) \cap M_S \neq 0$ . We may assume  $e/s$  has the form  $e/1$ , since  $A_S(e/s) = A_S(e/1)$ . Let

$$I_1 := M :_A e = \{a \in A \mid ae \in M\}.$$

Since  $E_A(M)$  is an essential extension of  $M$ , we have  $ae \neq 0$  for some  $a \in I_1$ . Since  $A$  is Noetherian,  $I_1$  is finitely generated, say  $I_1 = \langle a_1, \dots, a_k \rangle$ . Then  $a_i e/1 \in M_S$  for each  $i$ . If, for some  $i$ , we have  $a_i e/1 \neq 0$ , we are done. So assume  $a_i e/1 = 0$  for all  $i$ . Then there exists  $s_1 \in S$  such that  $s_1(a_i e) = a_i(s_1 e) = 0$  for all  $i$ . Since  $A_S(e/1) = A_S(s_1 e/1)$ , we may replace  $e$  with  $s_1 e$ . Let

$$I_2 := M :_A s_1 e = I_1 : s_1.$$

Since  $E_A(M)$  is an essential extension of  $M$ , we have  $a(s_1 e) \neq 0$  for some  $a \in I_2$ . This implies  $I_2 \supsetneq I_1$ , since  $I_1$  annihilates  $s_1 e$ . Proceeding inductively, we obtain a sequence of ideals

$$I_1 \subset I_2 \subset \dots,$$

which must terminate since  $A$  is Noetherian, say  $I_n = I_{n+1}$ . Then it easily follows that there exists some  $a \in I_n$  such that  $a(s_n \cdots s_1 e)/1 \neq 0$ , for if this was not the case, then we could construct an  $s_{n+1}$  as above, and deduce that  $I_{n+1} \supsetneq I_n$ , which is a contradiction. □

*Proof.* Note that  $\bigoplus_{i=1}^n E(M_i)$  is injective, and by the previous lemma it is essential over  $\bigoplus_{i=1}^n M_i$ , hence we are done. □

In the next theorem, we determine the indecomposable injective  $A$ -modules of a Noetherian ring  $A$ . Recall that an  $A$ -module  $M$  is **decomposable** if there exist nonzero submodules  $M_1, M_2$  of  $M$  such that  $M = M_1 \oplus M_2$ ; otherwise it is **indecomposable**.

**Theorem 9.15.** *Let  $A$  be a Noetherian ring.*

1. *For all  $\mathfrak{p} \in \text{Spec}(A)$ , the module  $E(A/\mathfrak{p})$  is indecomposable.*
2. *Let  $E \neq 0$  be an injective  $A$ -module and let  $\mathfrak{p} \in \text{Ass}(E)$ . Then  $E(A/\mathfrak{p})$  is a direct summand of  $E$ . In particular, if  $E$  is indecomposable, then  $E \cong E(A/\mathfrak{p})$ .*
3. *Let  $\mathfrak{p}, \mathfrak{q} \in \text{Spec}(A)$ . Then  $E(A/\mathfrak{p}) \cong E(A/\mathfrak{q})$  if and only if  $\mathfrak{p} = \mathfrak{q}$ .*

*Proof.*

1. Suppose  $E(A/\mathfrak{p})$  is decomposable. Then there exist nonzero submodules  $N_1, N_2$  of  $E(A/\mathfrak{p})$  such that  $N_1 \cap N_2 = 0$ . It follows that

$$(N_1 \cap (A/\mathfrak{p})) \cap (N_2 \cap (A/\mathfrak{p})) = (N_1 \cap N_2) \cap (A/\mathfrak{p}) = 0.$$

On the other hand, since  $A/\mathfrak{p} \subseteq_e E(A/\mathfrak{p})$  is an essential extension, we have

$$N_1 \cap (A/\mathfrak{p}) \neq 0 \neq N_2 \cap (A/\mathfrak{p}).$$

This contradicts the fact that  $A/\mathfrak{p}$  is a domain:  $N_1 \cap (A/\mathfrak{p})$  and  $N_2 \cap (A/\mathfrak{p})$  are ideals in  $A/\mathfrak{p}$ . Denoting these ideals as  $I_1$  and  $I_2$  respectively, in a domain we have  $I_1 \cap I_2 = 0$  implies either  $I_1 = 0$  or  $I_2 = 0$ .

2.  $A/\mathfrak{p}$  may be considered as a submodule of  $E$  since  $\mathfrak{p} \in \text{Ass}(E)$ . It follows that there exists an injective hull  $E(A/\mathfrak{p})$  of  $A/\mathfrak{p}$  such that  $E(A/\mathfrak{p}) \subset E$ . As  $E(A/\mathfrak{p})$  is injective, it is a direct summand of  $E$ .
3. Statement 3 follows from the next lemma. □

**Lemma 9.16.** *Let  $A$  be a Noetherian ring,  $\mathfrak{p} \in \text{Spec}(A)$ , and  $M$  a finitely generated  $A$ -module. Then*

1.  *$\text{Ass}(M) = \text{Ass}(E(M))$ ; in particular, one has  $\{\mathfrak{p}\} = \text{Ass}(E(A/\mathfrak{p}))$ .*

$$2. k(\mathfrak{p}) \cong \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E(A/\mathfrak{p})_{\mathfrak{p}}) \cong \text{Hom}_A(A/\mathfrak{p}, E(A/\mathfrak{p}))_{\mathfrak{p}}.$$

*Proof.*

1. It is clear that  $\text{Ass}(M) \subset \text{Ass}(E(M))$ . Conversely, suppose  $\mathfrak{p} \in \text{Ass}(E(M))$ . Then there exists  $e \in E(M)$  such that  $\mathfrak{p} = 0 : e$ . Since  $M \subseteq_e E(M)$  is essential, we have  $Ae \cap M \neq 0$ . Thus, there exists  $a \in A \setminus \mathfrak{p}$  such that  $ae \in M$ . Then

$$\begin{aligned} 0 : ae &= (0 : e) : a \\ &= \mathfrak{p} : a \\ &= \mathfrak{p}, \end{aligned}$$

implies  $\mathfrak{p} \in \text{Ass}(M)$ .

2. Since  $E(A/\mathfrak{p})_{\mathfrak{p}} \cong E_{A_{\mathfrak{p}}}(k(\mathfrak{p}))$ , we assume that  $(A, \mathfrak{m}, k)$  is local and  $\mathfrak{p} = \mathfrak{m}$  is the maximal ideal. The  $k$ -vector space  $\text{Hom}_A(k, E(k))$  may be identified with

$$V = \{e \in E(k) \mid \mathfrak{m}e = 0\} = \text{Soc}(E(k)),$$

which contains  $k$ . If  $V \neq k$ , then there exists a nonzero vector subspace  $W$  of  $V$  with  $k \cap W = 0$ . This, however, contradicts the essentiality of the extension  $k \subset E(k)$ . The second isomorphism follows from

$$\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E(A/\mathfrak{p})_{\mathfrak{p}}) = \text{Hom}_{A_{\mathfrak{p}}}(A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}}, E(A/\mathfrak{p})_{\mathfrak{p}}) \cong \text{Hom}_{A_{\mathfrak{p}}}((A/\mathfrak{p})_{\mathfrak{p}}, E(A/\mathfrak{p})_{\mathfrak{p}}) \cong \text{Hom}_A(A/\mathfrak{p}, E(A/\mathfrak{p}))_{\mathfrak{p}}$$

□

The importance of the indecomposable injective  $A$ -modules results from the following:

**Theorem 9.17.** *Let  $A$  be a Noetherian ring. Every injective  $A$ -module  $E$  is a direct sum of indecomposable injective  $A$ -modules, and this decomposition is unique in the following sense: for any  $\mathfrak{p} \in \text{Spec}(A)$ , the number of indecomposable summands in the decomposition of  $E$  which are isomorphic to  $E(A/\mathfrak{p})$  depends only on  $E$  and  $\mathfrak{p}$  (and not on the particular decomposition). In fact, this number equals*

$$\dim_{k(\mathfrak{p})} (\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_{\mathfrak{p}})).$$

*Proof.* Consider the set  $\mathcal{I}$  of all subsets of the set of indecomposable injective submodules of  $E$  with the property: if  $\mathcal{F} \in \mathcal{I}$ , then the sum of all modules belonging to  $\mathcal{F}$  is direct. The set  $\mathcal{I}$  is partially ordered by inclusion. By Zorn's lemma it has a maximal element  $\mathcal{F}'$ . Let  $F$  be the sum of all the modules in  $\mathcal{F}'$ . The module  $F$  is a direct sum of injective modules, and hence is itself injective. Therefore  $F$  is a direct summand of  $E$ , and we can write  $E = F \oplus H$ , where  $H$  is injective since it is a direct summand of  $E$ . Suppose  $H \neq 0$ , then there exists  $\mathfrak{p} \in \text{Ass}(H)$ , and so  $E(A/\mathfrak{p})$  is a direct summand of  $H$ . Thus we may enlarge  $\mathcal{F}'$  by  $E(A/\mathfrak{p})$ , contradicting the maximality of  $\mathcal{F}'$ . We conclude that  $H = 0$  and  $E = F$ .

Suppose that  $E = \bigoplus_{\lambda \in \Lambda} E_{\lambda}$  is the given decomposition. Then

$$\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_{\mathfrak{p}}) \cong \text{Hom}_{A_{\mathfrak{p}}}\left(k(\mathfrak{p}), \bigoplus_{\lambda \in \Lambda} (E_{\lambda})_{\mathfrak{p}}\right) \cong \bigoplus_{\lambda \in \Lambda} \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), (E_{\lambda})_{\mathfrak{p}}),$$

where we used the fact that  $k(\mathfrak{p})$  is finitely generated in the second isomorphism. By Lemma (9.16), we have

$$\bigoplus_{\lambda \in \Lambda} \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), (E_{\lambda})_{\mathfrak{p}}) \cong \bigoplus_{\lambda \in \Lambda_0} \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), (E_{\lambda})_{\mathfrak{p}})$$

where  $\Lambda_0 = \{\lambda \in \Lambda \mid E_{\lambda} \cong E(A/\mathfrak{p})\}$ . If we again use Lemma (9.16), we finally get

$$\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_{\mathfrak{p}}) \cong \bigoplus_{\lambda \in \Lambda_0} \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), (E_{\lambda})_{\mathfrak{p}}) \cong k(\mathfrak{p})^{\Lambda_0}$$

□

**Theorem 9.18.** *Let  $A$  be a Noetherian ring and  $E$  an injective  $A$ -module. Then*

$$E \cong \bigoplus_i E_A(A/\mathfrak{p}_i),$$

where  $\mathfrak{p}_i$  are prime ideals of  $A$ . Moreover, any such direct sum is an injective  $A$ -module.

*Proof.* Let  $E$  be an injective  $A$ -module. By Zorn's Lemma, there exists a maximal family  $\{E_i\}$  of injective submodules of  $E$  such that  $E_i \cong E_A(A/\mathfrak{p}_i)$ , and their sum in  $E$  is a direct sum. Let  $E' = \bigoplus_i E_i$ , which is an injective module, and hence is a direct summand of  $E$ . There exists an  $A$ -module  $E''$  such that  $E = E' \oplus E''$ . If  $E'' \neq 0$ , pick a nonzero element  $x \in E''$ . Let  $\mathfrak{p}$  be an associated prime of  $Ax$ . Then  $A/\mathfrak{p} \hookrightarrow Ax \subseteq E''$ , so there is a copy of  $E_A(A/\mathfrak{p})$  contained in  $E''$  and  $E'' = E_A(A/\mathfrak{p}) \oplus E'''$ , contradicting the maximality of the family  $\{E_i\}$ .  $\square$

**Theorem 9.19.** *Let  $A$  be a Noetherian ring,  $\mathfrak{p}$  be a prime ideal of  $A$ ,  $E = E_A(A/\mathfrak{p})$  and let  $k = A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}}$ . Then*

1. *If  $x \in A \setminus \mathfrak{p}$ , then  $E \xrightarrow{\cdot x} E$  is an isomorphism, and so  $E = E_{\mathfrak{p}}$ .*
2.  *$0 :_E \mathfrak{p} = k$ .*
3.  *$k \subseteq E$  is an essential extension of  $A_{\mathfrak{p}}$ -modules and  $E = E_{A_{\mathfrak{p}}}(k)$ .*
4.  *$E$  is  $\mathfrak{p}$ -torsion and  $\text{Ass}(E) = \{\mathfrak{p}\}$ .*
5.  *$\text{Hom}_{A_{\mathfrak{p}}}(k, E) = k$  and  $\text{Hom}_{A_{\mathfrak{p}}}(k, E_A(A/\mathfrak{q})_{\mathfrak{p}}) = 0$  for primes  $\mathfrak{q} \neq \mathfrak{p}$ .*

*Proof.*

1. Since  $A/\mathfrak{p}$  is a domain and  $Q(A/\mathfrak{p}) = k$ , Proposition (9.9) tells us that  $k$  is an essential extension of  $A/\mathfrak{p}$ , so  $E$  contains a copy of  $k$  and we may assume  $A/\mathfrak{p} \subseteq k \subseteq E$ . Multiplication by  $x \in A \setminus \mathfrak{p}$  is injective on  $k$ , and hence also on its essential extension  $E$ . The submodule  $xE$  is injective, so it is a direct summand of  $E$ . But  $k \subseteq xE \subseteq E$  are essential extensions, so  $xE = E$ .
2.  $0 :_E \mathfrak{p} = 0 :_E \mathfrak{p}A_{\mathfrak{p}}$  is a vector space over the field  $k$ , and hence the inclusion  $k \subseteq 0 :_E \mathfrak{p}$  splits. But  $k \subseteq 0 :_E \mathfrak{p} \subseteq E$  is an essential extension, so  $0 :_E \mathfrak{p} = k$ .
3. The containment  $k \subseteq E$  is an essential extension of  $A$ -modules, hence also of  $A_{\mathfrak{p}}$ -modules. Suppose  $E \subseteq M$  is an essential extension of  $A_{\mathfrak{p}}$ -modules, pick  $m \in M$ . Then  $m$  has a nonzero multiple  $(a/s)m \in E$ , where  $s \in A \setminus \mathfrak{p}$ . But then  $am$  is a nonzero multiple of  $m$  in  $E$ , so  $E \subseteq M$  is an essential extension of  $A$ -modules, and therefore  $M = E$ .
4. Let  $\mathfrak{q} \in \text{Ass}(E)$ . Then there exists  $x \in E$  such that  $Ax \subseteq E$  and  $0 :_A x = \mathfrak{q}$ . Since  $A/\mathfrak{p} \subseteq E$  is essential,  $x$  has a nonzero multiple  $y = ax$  in  $A/\mathfrak{p}$ . But then the  $\mathfrak{p} = 0 :_A y = 0 :_E ax = (0 :_E x) :_A a$  implies  $\mathfrak{q} = \mathfrak{p}$ . Therefore  $\text{Ass}(E) = \{\mathfrak{p}\}$ . Now suppose  $x \in E$ . Then  $0 :_E x$  must be  $\mathfrak{p}$ -primary since  $\mathfrak{p}$  is the only associated prime of  $0 :_E x \hookrightarrow E$ . In particular,  $0 :_E x \supset \mathfrak{p}^n$  for some  $n$ , and this proves our claim.
5. For the first assertion,

$$\text{Hom}_{A_{\mathfrak{p}}}(k, E) = \text{Hom}_{A_{\mathfrak{p}}}(A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}}, E) \cong 0 :_E \mathfrak{p}A_{\mathfrak{p}} = k.$$

For the first assertion, if  $\mathfrak{q} \subsetneq \mathfrak{p}$ , then  $\mathfrak{q}^n \subsetneq \mathfrak{p}$ . Therefore since  $E_A(A/\mathfrak{q})$  is  $\mathfrak{q}$ -torsion, we see that  $E_A(A/\mathfrak{q})_{\mathfrak{p}} = 0$  if  $\mathfrak{q} \subsetneq \mathfrak{p}$ . In the case  $\mathfrak{q} \subseteq \mathfrak{p}$ , we have

$$\text{Hom}_{A_{\mathfrak{p}}}(k, E_A(A/\mathfrak{q})_{\mathfrak{p}}) \cong 0 :_{E_A(A/\mathfrak{q})_{\mathfrak{p}}} \mathfrak{p}A_{\mathfrak{p}} = 0 :_{E_A(A/\mathfrak{q})} \mathfrak{p}A_{\mathfrak{p}}.$$

If this is nonzero, then there is a nonzero element of  $E_A(A/\mathfrak{q})$  killed by  $\mathfrak{p}$ , which forces  $\mathfrak{q} = \mathfrak{p}$  since  $\text{Ass}(E_A(A/\mathfrak{q})) = \{\mathfrak{q}\}$ .  $\square$

**Theorem 9.20.** *Let  $A$  be a Noetherian ring and  $\mathfrak{p}$  be a prime ideal of  $A$ . Then*

1. *If  $x \in A \setminus \mathfrak{p}$ , then  $E_A(A/\mathfrak{p}) \xrightarrow{\cdot x} (A/\mathfrak{p})$  is an isomorphism, and so  $E_A(A/\mathfrak{p}) = E_A(A/\mathfrak{p})_{\mathfrak{p}}$ .*
2.  *$\text{Hom}_A(A/\mathfrak{p}, E_A(A/\mathfrak{p})) = 0 :_{E_A(A/\mathfrak{p})} \mathfrak{p} = 0 :_{E_A(A/\mathfrak{p})_{\mathfrak{p}}} k(\mathfrak{p}) = 0 :_{E_{A_{\mathfrak{p}}}(k(\mathfrak{p}))} k(\mathfrak{p}) = \text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_{A_{\mathfrak{p}}}(k(\mathfrak{p}))) = k(\mathfrak{p})$ .*
3.  *$\text{Ass}(E_A(A/\mathfrak{p})) = \{\mathfrak{p}\}$  and  $E_A(A/\mathfrak{p})$  is  $\mathfrak{p}$ -torsion.*
4.  *$\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_A(A/\mathfrak{q})_{\mathfrak{p}}) = 0$  for primes  $\mathfrak{q} \neq \mathfrak{p}$ .*

*Proof.*

1. Since  $A/\mathfrak{p}$  is a domain and  $Q(A/\mathfrak{p}) = k$ , Proposition (9.9) tells us that  $k$  is an essential extension of  $A/\mathfrak{p}$ , so  $E$  contains a copy of  $k$  and we may assume  $A/\mathfrak{p} \subseteq k \subseteq E$ . Multiplication by  $x \in A \setminus \mathfrak{p}$  is injective on  $k$ , and hence also on its essential extension  $E$ . The submodule  $xE$  is injective, so it is a direct summand of  $E$ . But  $k \subseteq xE \subseteq E$  are essential extensions, so  $xE = E$ .

2.  $0 :_E \mathfrak{p} = 0 :_E \mathfrak{p}A_{\mathfrak{p}}$  is a vector space over the field  $k$ , and hence the inclusion  $k \subseteq 0 :_E \mathfrak{p}$  splits. But  $k \subseteq 0 :_E \mathfrak{p} \subseteq E$  is an essential extension, so  $0 :_E \mathfrak{p} = k$ .
3. The containment  $k \subseteq E$  is an essential extension of  $A$ -modules, hence also of  $A_{\mathfrak{p}}$ -modules. Suppose  $E \subseteq M$  is an essential extension of  $A_{\mathfrak{p}}$ -modules, pick  $m \in M$ . Then  $m$  has a nonzero multiple  $(a/s)m \in E$ , where  $s \in A \setminus \mathfrak{p}$ . But then  $am$  is a nonzero multiple of  $m$  in  $E$ , so  $E \subseteq M$  is an essential extension of  $A$ -modules, and therefore  $M = E$ .
4. Let  $\mathfrak{q} \in \text{Ass}(E)$ . Then there exists  $x \in E$  such that  $Ax \subseteq E$  and  $0 :_A x = \mathfrak{q}$ . Since  $A/\mathfrak{p} \subseteq E$  is essential,  $x$  has a nonzero multiple  $y = ax$  in  $A/\mathfrak{p}$ . But then the  $\mathfrak{p} = 0 :_A y = 0 :_E ax = (0 :_E x) :_A a$  implies  $\mathfrak{q} = \mathfrak{p}$ . Therefore  $\text{Ass}(E) = \{\mathfrak{p}\}$ . Now suppose  $x \in E$ . Then  $0 :_E x$  must be  $\mathfrak{p}$ -primary since  $\mathfrak{p}$  is the only associated prime of  $0 :_E x \hookrightarrow E$ . In particular,  $0 :_E x \supseteq \mathfrak{p}^n$  for some  $n$ , and this proves our claim.
5. For the first assertion,

$$\text{Hom}_{A_{\mathfrak{p}}}(k, E) = \text{Hom}_{A_{\mathfrak{p}}}(A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}}, E) \cong 0 :_E \mathfrak{p}A_{\mathfrak{p}} = k.$$

For the first assertion, if  $\mathfrak{q} \subsetneq \mathfrak{p}$ , then  $\mathfrak{q}^n \subsetneq \mathfrak{p}$ . Therefore since  $E_A(A/\mathfrak{q})$  is  $\mathfrak{q}$ -torsion, we see that  $E_A(A/\mathfrak{q})_{\mathfrak{p}} = 0$  if  $\mathfrak{q} \subsetneq \mathfrak{p}$ . In the case  $\mathfrak{q} \subseteq \mathfrak{p}$ , we have

$$\text{Hom}_{A_{\mathfrak{p}}}(k, E_A(A/\mathfrak{q})_{\mathfrak{p}}) \cong 0 :_{E_A(A/\mathfrak{q})_{\mathfrak{p}}} \mathfrak{p}A_{\mathfrak{p}} = 0 :_{E_A(A/\mathfrak{q})} \mathfrak{p}A_{\mathfrak{p}}.$$

If this is nonzero, then there is a nonzero element of  $E_A(A/\mathfrak{q})$  killed by  $\mathfrak{p}$ , which forces  $\mathfrak{q} = \mathfrak{p}$  since  $\text{Ass}(E_A(A/\mathfrak{q})) = \{\mathfrak{q}\}$ .

□

**Theorem 9.21.** *Let  $A$  be a Noetherian ring and let  $E$  be an injective  $A$ -module. Then*

$$E = \bigoplus_{\mathfrak{p} \in \text{Spec}(A)} E_A(A/\mathfrak{p})^{\alpha_{\mathfrak{p}}}$$

and the numbers  $\alpha_{\mathfrak{p}}$  are independent of the direct sum decomposition.

*Proof.* By Theorem (9.18), there is a direct sum

$$E \cong \bigoplus_i E_A(A/\mathfrak{p}_i).$$

Theorem (9.20) implies  $\alpha_{\mathfrak{p}}$  is the dimension of the  $k(\mathfrak{p})$ -vector space

$$\text{Hom}_{A_{\mathfrak{p}}}(k(\mathfrak{p}), E_{\mathfrak{p}}),$$

which does not depend on the decomposition.

□

## 10 Flatness

### 10.1 Definition of Flatness

**Definition 10.1.** Let  $F$  be an  $R$ -module. We say  $F$  is **flat** if for every injective  $R$ -linear map  $\varphi: M \rightarrow N$ , the induced map  $1 \otimes \varphi: F \otimes_R M \rightarrow F \otimes_R N$  is again injective. An  $R$ -algebra  $A$  is called flat if it is flat as an  $R$ -module.

An equivalent definition of being flat is given in the following proposition:

**Proposition 10.1.** *Let  $F$  be an  $R$ -module. Then  $F$  is flat if and only if the covariant function  $F \otimes_R -$  is exact.*

*Proof.* Suppose that  $F$  is flat. Let

$$0 \longrightarrow M_1 \xrightarrow{\varphi_1} M_2 \xrightarrow{\varphi_2} M_3 \longrightarrow 0$$

be an exact sequence of  $R$ -modules. Since  $F \otimes_R -$  is right exact, we only need to check that

$$0 \longrightarrow F \otimes_R M_1 \xrightarrow{1 \otimes \varphi_1} F \otimes_R M_2$$

is exact at  $F \otimes_R M_1$ . This is equivalent to showing  $1 \otimes \varphi_1$  is injective, and this holds since  $F$  is flat. Conversely, suppose  $F \otimes_R -$  is exact. Let  $\varphi: M \rightarrow N$  be any injective  $R$ -linear map. Since  $F \otimes_R -$  is exact, the induced map  $1 \otimes \varphi: F \otimes_R M \rightarrow F \otimes_R N$  is also injective. In other words,  $F$  is flat.

□

**Example 10.1.** Free modules are flat.

**Example 10.2.** Let  $x \in R$ . Then  $R/x$  is not a flat  $R$ -module. Indeed, let  $I$  be any finitely generated ideal in  $R$ . Then

$$I/Ix \cong I \otimes_R R/x \rightarrow I(R/x) \cong I/(I \cap x)$$

is injective if and only if  $Ix = I \cap x$ . In particular, if  $I$  contains  $x$ , then this map is not injective.

**Example 10.3.** Let  $R = K[x]$  and  $A = K[x, y]/\langle xy, y^2 \rangle$ . Then  $A$  is an  $R$ -algebra via the unique map  $\varphi: R \rightarrow A$  such that  $\varphi(x) = \bar{x}$ , but  $A$  is not flat as an  $R$ -module since  $\langle x \rangle \otimes_R A \rightarrow \bar{x}A$  is not injective. For instance,  $x \otimes \bar{y} \mapsto \bar{x}\bar{y} = 0$  in  $\bar{x}A$ , but  $x \otimes \bar{y} \neq 0$  in  $\langle x \rangle \otimes_A B$ .

## 10.2 Criterion for Flatness Using Tor

**Theorem 10.1.** Let  $M$  be an  $R$ -module. Then  $M$  is flat if and only if

$$\mathrm{Tor}_1^R(R/I, M) \cong 0$$

for all finitely generated ideals  $I$  in  $R$ .

*Remark.* Before we give a proof, we first make the following observation; namely that if  $I$  is an ideal in  $R$ , then  $\mathrm{Tor}_1^R(R/I, M) \cong 0$  if and only if  $I \otimes_R M \rightarrow M$  is injective. Indeed, applying  $- \otimes_R M$  to the short exact sequence

$$0 \longrightarrow I \longrightarrow R \longrightarrow R/I \longrightarrow 0$$

gives us the exact sequence

$$0 \cong \mathrm{Tor}_1^R(R, M) \longrightarrow \mathrm{Tor}_1^R(R/I, M) \longrightarrow I \otimes_R M \longrightarrow R \otimes_R M \cong M. \quad (47)$$

From the exact sequence (46), we see that  $\mathrm{Tor}_1^R(R/I, M) \cong 0$  if and only if  $I \otimes_R M \rightarrow M$  is injective.

*Proof.* Suppose  $M$  is flat and let  $I$  be a finitely generated ideal in  $R$ . It follows from Remark (10.2) that  $\mathrm{Tor}_1^R(R/I, M) \cong 0$ . Since  $I$  was arbitrary, this implies  $\mathrm{Tor}_1^R(R/I, M) \cong 0$  for all finitely generated ideals  $I \subset R$ .

Now assume  $\mathrm{Tor}_1^R(R/I, M) \cong 0$  for all finitely generated ideals  $I \subset R$ . Thus  $I \otimes_R M \rightarrow M$  is injective for all finitely generated ideals  $I \subset R$  by Remark (10.2). What we need to show is that, for any injective map  $\iota: L \rightarrow N$ , the induced map  $L \otimes_R M \rightarrow N \otimes_R M$  is injective. First consider the case of the inclusion map  $I \subset R$  where  $I$  is an ideal (not necessarily finitely generated). Assume for a contradiction that  $I \otimes_R M \rightarrow M$  is not injective. Choose

$$\sum_{i=1}^n x_i \otimes u_i \in I \otimes_R M$$

different from zero with  $\sum_{i=1}^n x_i u_i = 0$ . Let  $I_0 := \langle x_1, \dots, x_n \rangle$ . Then

$$\sum_{i=1}^n x_i \otimes u_i \in I_0 \otimes_R M$$

and, therefore, by assumption, it has to be zero. In particular, its image in  $I \otimes_R M$  has to be zero too, which is a contradiction. Thus  $I \otimes_R M \rightarrow M$  is injective for all ideals  $I \subset R$ .

Now we consider the more general case. Let  $\iota: L \rightarrow N$  be an injective map. If  $L \otimes_R M \rightarrow N \otimes_R M$  is not injective, then there exists

$$\sum_{i=1}^n u_i \otimes v_i \in L \otimes_A M$$

different from zero with

$$\sum_{i=1}^n \iota(u_i) \otimes v_i = 0.$$

Setting  $N_0 = \sum_{i=1}^n \iota(u_i)R$ , this would imply  $L \otimes_A M \rightarrow N_0 \otimes_A M$  is not injective. So by passing to  $N_0$  if necessary, we may assume that  $N$  is finitely generated.

Since  $N$  is finitely generated, we can find an increasing chain

$$L = L_0 \subset L_1 \subset \dots \subset L_r = N$$

of  $R$ -modules such that each quotient  $L_{i+1}/L_i$  is generated by one element, that is,  $L_{i+1}/L_i \cong R/I_i$  for some ideal  $I_i$ . Since the map  $L \otimes_R M \rightarrow N \otimes_R M$  is equal to the composition of the maps  $L_i \otimes_A M \rightarrow L_{i+1} \otimes_A M$ , it is enough to show that  $L_i \otimes_A M \rightarrow L_{i+1} \otimes_A M$  is injective for all  $i$ . We have therefore reduced the statement to the case that  $L/N \cong R/I$ . Now, consider the exact sequence

$$\mathrm{Tor}_1^R(R/I, M) = \mathrm{Tor}_1^R(L/N, M) \longrightarrow N \otimes_R M \longrightarrow L \otimes_R M.$$

By assumption,  $\mathrm{Tor}_1^R(R/I, M) = 0$ , and so  $L \otimes_A M \rightarrow N \otimes_A M$  is injective. □

### 10.3 Criterion for Flatness Using Equations

We want to give another criterion for flatness, in terms of equations in  $M$ , but first we need a lemma.

**Lemma 10.2.** Let  $M$  and  $N$  be  $R$ -modules, let  $I$  be an indexing set, let  $u_i \in M$  for all  $i \in I$ , and let  $N = \langle v_i \mid i \in I \rangle$ . Then  $\sum_{i \in I} u_i \otimes v_i = 0$  <sup>5</sup> if and only if there exists an indexing set  $J$  and there exists  $a_{ij} \in R$  and  $\tilde{u}_j \in M$ , for  $i \in I$  and  $j \in J$ , such that

1.  $\sum_{j \in J} a_{ij} \tilde{u}_j = u_i$  for all  $i \in I$ , and;
2.  $\sum_{i \in I} a_{ij} v_i = 0$  for all  $j \in J$ .

*Proof.* Suppose  $\sum_{j \in J} a_{ij} \tilde{u}_j = u_i$  and  $\sum_{i \in I} a_{ij} v_i = 0$ , then

$$\begin{aligned} \sum_{i \in I} u_i \otimes v_i &= \sum_{i \in I} \left( \sum_{j \in J} a_{ij} \tilde{u}_j \right) \otimes v_i \\ &= \sum_{j \in J} \tilde{u}_j \otimes \left( \sum_{i \in I} a_{ij} v_i \right) \\ &= \sum_{j \in J} \tilde{u}_j \otimes 0 \\ &= 0. \end{aligned}$$

Conversely, suppose  $\sum_{i \in I} u_i \otimes v_i = 0$ . Let

$$F_1 \xrightarrow{\lambda} F_0 \xrightarrow{\pi} N \longrightarrow 0$$

be a presentation of  $N$  such that there is a basis  $\{f_j\}_{j \in J}$  of  $F_1$  and  $\{e_i\}_{i \in I}$  of  $F_0$  with  $\lambda(f_j) = \sum_{i \in I} a_{ij} e_i$  and  $\pi(e_i) = v_i$  for all  $i \in I$  and  $j \in J$ . Now apply  $M \otimes_R -$  to the presentation to get an exact sequence:

$$M \otimes_R F_1 \xrightarrow{1 \otimes \lambda} M \otimes_R F_0 \xrightarrow{1 \otimes \pi} M \otimes N \longrightarrow 0$$

In these terms our assumption reads,  $(1 \otimes \pi)(\sum_{i \in I} u_i \otimes e_i) = 0$ , which implies  $\sum_{i \in I} u_i \otimes e_i \in \ker(1 \otimes \pi)$ . By the exactness of the diagram above, there exists some  $\sum_{j \in J} \tilde{u}_j \otimes f_j \in M \otimes_A F_1$  such that  $(1 \otimes \lambda)(\sum_{j \in J} \tilde{u}_j \otimes f_j) = \sum_{i \in I} u_i \otimes e_i$ . So

$$\begin{aligned} \sum_{i \in I} u_i \otimes e_i &= (1 \otimes \lambda) \left( \sum_{j \in J} \tilde{u}_j \otimes f_j \right) \\ &= \sum_{j \in J} 1(\tilde{u}_j) \otimes \lambda(f_j) \\ &= \sum_{j \in J} \tilde{u}_j \otimes \left( \sum_{i \in I} a_{ij} e_i \right) \\ &= \sum_{i \in I} \left( \sum_{j \in J} a_{ij} \tilde{u}_j \right) \otimes e_i. \end{aligned}$$

This implies  $u_i = \sum_{j \in J} a_{ij} \tilde{u}_j$ , since  $M \otimes_R F_0$  is a free  $R$ -module with basis  $\{e_i\}_{i \in I}$ . To show  $\sum_{i \in I} a_{ij} v_i = 0$ , note that  $\sum_{i \in I} a_{ij} v_i = \pi(\lambda(f_j)) = 0$ .  $\square$

**Proposition 10.2.** Let  $M$  be an  $R$ -module. Then  $M$  is flat if and only if the following condition is satisfied: If  $\sum_{i=1}^r a_i u_i = 0$  where  $a_i \in R$  and  $u_i \in M$ . Then there exists  $a_{ij} \in R$  and  $\tilde{u}_j \in M$  such that

1.  $\sum_{j=1}^s a_{ij} \tilde{u}_j = u_i$  for all  $i = 1, \dots, r$
2.  $\sum_{i=1}^r a_{ij} u_i = 0$  for all  $j = 1, \dots, s$ .

*Proof.* Assume that  $M$  is flat. Suppose

$$\sum_{i=1}^r a_i u_i = 0,$$

where  $a_i \in R$  and  $u_i \in M$ . Set  $I := \langle a_1, \dots, a_r \rangle$ . Since  $M$  is flat, the map  $I \otimes_R M \rightarrow M$ , induced by  $I \subset R$ , is injective. This implies  $\sum_{i=1}^r a_i \otimes u_i = 0$ , and the result follows from Lemma (10.2).

Conversely, assume that the condition above is satisfied, and let  $I \subset R$  be a finitely generated ideal. By Theorem (10.1), it suffices to prove that  $\text{Tor}_1^R(R/I, M) = 0$ , or equivalently, that the induced map  $I \otimes_R M \rightarrow M$  is injective. Let  $\sum_{i=1}^r a_i \otimes u_i \in I \otimes_R M$  such that  $\sum_i a_i u_i = 0$ . Then again by Lemma (10.2), we see that  $\sum_{i=1}^r a_i \otimes u_i = 0$ . Thus  $I \otimes_R M \rightarrow M$  is injective.  $\square$

<sup>5</sup>Of course, there are only finitely many indices  $i \in I$  with  $u_i \neq 0$  in such a sum.

Let  $I = \langle a \rangle \subset R$  be a principal ideal. Then the preceding proof shows that the induced map  $\langle a \rangle \otimes_R M \rightarrow M$  is injective if and only if the following condition holds:  $au = 0$  for  $u \in M$  implies that there exists  $a_1, \dots, a_s \in A$  and  $\tilde{u}_1, \dots, \tilde{u}_s \in M$  such that  $u = \sum_{i=1}^s a_i \tilde{u}_i$  and  $aa_i = 0$  for all  $i$ . In other words,  $\langle a \rangle \otimes_R M \rightarrow M$  is injective if and only if

$$\text{Ann}_M(a) \subset \text{Ann}_R(a) \cdot M.$$

Since the other inclusion is obvious, we have shown

**Corollary.** *Let  $A$  be a principal ideal ring. Then an  $R$ -module  $M$  is flat if and only if*

$$\text{Ann}_M(a) = \text{Ann}_A(a) \cdot M$$

*for every  $a \in A$ . Moreover, if  $A$  is integral, then  $M$  is flat if and only if it is torsion free.*

**Corollary.** *A  $K[\varepsilon]$ -module is flat if and only if  $\text{Ann}_M(\varepsilon) = \varepsilon M$ , i.e. the multiplication by  $\varepsilon$  induces an isomorphism  $M/\varepsilon M \cong \varepsilon M$ .*

### 10.3.1 Finitely Generated Flat Modules over Local Ring are Free

**Proposition 10.3.** *Let  $(R, \mathfrak{m})$  be a local ring and let  $M$  be a flat  $R$ -module. Moreover, let  $u_1, \dots, u_k \in M$  such that their classes  $\bar{u}_1, \dots, \bar{u}_k$  in  $M/\mathfrak{m}M$  are linearly independent. Then  $u_1, \dots, u_k$  are linearly independent. In particular, a finitely generated  $R$ -module is flat if and only if it is free.*

*Proof.* We use induction on  $k$ . Let  $k = 1$  and assume  $au_1 = 0$  for some  $a \in R$ . Using Proposition (10.2), we obtain  $\tilde{u}_j \in M$  and  $a_j \in R$  such that  $\sum_j a_j \tilde{u}_j = u_1$  and  $aa_j = 0$  for all  $j$ . But  $u_1 \notin \mathfrak{m}M$  implies  $a_j \notin \mathfrak{m}$  for some  $j$ , and therefore  $a = 0$ .

Assume the corollary is proved for  $k - 1$ . Let  $\sum_{i=1}^k a_i u_i = 0$ . We use Proposition (10.2) again and obtain  $\tilde{u}_j \in M$  and  $a_{ij} \in A$  such that  $\sum_j a_{ij} \tilde{u}_j = u_i$  and  $\sum_i a_{ij} a_j = 0$  for all  $i$  and for all  $j$  respectively. Because  $u_k \notin \mathfrak{m}M$ , we have  $a_{kj} \notin \mathfrak{m}$  for some  $j$ . This implies that  $a_k$  is a linear combination of  $a_1, \dots, a_{k-1}$

$$a_k = \sum_{i=1}^{k-1} h_i a_i$$

for  $h_i = -a_{ij}/a_{kj}$ . Now we have

$$\begin{aligned} 0 &= \sum_{i=1}^k a_i u_i \\ &= \sum_{i=1}^{k-1} a_i u_i + a_k u_k \\ &= \sum_{i=1}^{k-1} a_i u_i + \sum_{i=1}^{k-1} h_i a_i u_k \\ &= \sum_{i=1}^{k-1} a_i (u_i + h_i u_k). \end{aligned}$$

The induction hypothesis implies that  $a_1 = \dots = a_{k-1} = 0$ , and therefore  $a_k = 0$  by the base case.  $\square$

## 10.4 More Properties of Flat Modules

**Lemma 10.3.** *Let  $M$  be a flat  $R$ -module, let  $\{M_\lambda\}_{\lambda \in \Lambda}$  be a collection of  $R$ -modules indexed by a set  $\Lambda$ , and let  $S$  be a multiplicatively closed subset of  $R$ . Then*

1.  $\bigoplus_{\lambda \in \Lambda} M_\lambda$  is flat if and only if all the  $M_\lambda$  are flat.
2.  $M_S$  is a flat  $R_S$ -module, and hence a flat  $R$ -module.

*Proof.*

1. Since we have isomorphisms

$$N \otimes_R \left( \bigoplus_{\lambda \in \Lambda} M_\lambda \right) \cong \bigoplus_{\lambda \in \Lambda} (N \otimes_R M_\lambda)$$

natural in  $N$ , the functor  $- \otimes_R (\bigoplus_{\lambda \in \Lambda} M_\lambda)$  is exact if and only if the functors  $- \otimes_R M_\lambda$  are exact for all  $\lambda \in \Lambda$ .

2. Let  $I_S$  be an ideal in  $R_S$ . Since localization is exact and commutes with tensor products, we see that  $I \otimes_R M \rightarrow M$  is injective implies  $I_S \otimes_{R_S} M_S \rightarrow M_S$  is injective. Therefore  $M_S$  is a flat  $R_S$ -module. To see that  $M_S$  is a flat  $R$ -module, note that

$$\begin{aligned} I \otimes_R M_S &\cong I \otimes_R (R_S \otimes_{R_S} M_S) \\ &\cong (I \otimes_R R_S) \otimes_{R_S} M_S \\ &\cong I_S \otimes_{R_S} M_S. \end{aligned}$$

Thus injectivity of  $I \otimes_R M_S \rightarrow M_S$  is equivalent to injectivity of  $I_S \otimes_{R_S} M_S \rightarrow M_S$ .  $\square$

**Corollary.** *Let  $P$  be a projective  $R$ -module. Then  $P$  is flat.*

*Proof.* First note that every free module is flat. Indeed,  $R$  is flat as an  $R$ -module and every free module is a direct sum of copies of  $R$ . Thus Lemma (10.3) implies every free module is flat. Since  $P$  is projective, there exists an  $R$ -module  $K$  and a free  $R$ -module  $F$  such that  $P \oplus K \cong F$ . Then it follows from Lemma (10.3) that  $P$  is flat since  $F$  is flat.  $\square$

#### 10.4.1 Flat Modules are not necessarily Projective

**Proposition 10.4.**  *$\mathbb{Q}$  is a flat  $\mathbb{Z}$ -module that is not projective.*

*Proof.* It follows from Proposition (??) that  $\mathbb{Q}$  is a flat  $\mathbb{Z}$ -module, so we just need to show that  $\mathbb{Q}$  is not projective. Let  $\varphi: \bigoplus_{i \in \mathbb{N}} \mathbb{Z} \rightarrow \mathbb{Q}$  be the unique  $\mathbb{Z}$ -linear map defined on the standard basis  $\{e_n\}$  of  $\bigoplus_{i \in \mathbb{N}} \mathbb{Z}$  by

$$\varphi(e_n) = \frac{1}{n}$$

for all  $n \in \mathbb{N}$ , and let  $\psi: \mathbb{Q} \rightarrow \mathbb{Q}$  be the identity map. Observe that  $\varphi$  is surjective since if  $m/n \in \mathbb{Q}$ , then  $\varphi(me_n) = m/n$ . However there is no  $\tilde{\psi}: \mathbb{Q} \rightarrow \bigoplus_{n \in \mathbb{N}} \mathbb{Z}$  such that  $\psi = \varphi\tilde{\psi}$ . Indeed, observe that the injective map

$$\bigoplus_{n \in \mathbb{N}} \mathbb{Z} \rightarrow \prod_{n \in \mathbb{N}} \mathbb{Z}$$

induces the injective map

$$\mathrm{Hom}_{\mathbb{Z}} \left( \mathbb{Q}, \bigoplus_{n \in \mathbb{N}} \mathbb{Z} \right) \rightarrow \mathrm{Hom}_{\mathbb{Z}} \left( \mathbb{Q}, \prod_{n \in \mathbb{N}} \mathbb{Z} \right)$$

since  $\mathrm{Hom}_{\mathbb{Z}}(\mathbb{Q}, -)$  is a left-exact covariant functor. Therefore the injection

$$\begin{aligned} \mathrm{Hom}_{\mathbb{Z}} \left( \mathbb{Q}, \bigoplus_{n \in \mathbb{N}} \mathbb{Z} \right) &\rightarrow \mathrm{Hom}_{\mathbb{Z}} \left( \mathbb{Q}, \prod_{n \in \mathbb{N}} \mathbb{Z} \right) \\ &\cong \prod_{n \in \mathbb{N}} \mathrm{Hom}_{\mathbb{Z}}(\mathbb{Q}, \mathbb{Z}) \\ &\cong 0 \end{aligned}$$

implies

$$\mathrm{Hom}_{\mathbb{Z}} \left( \mathbb{Q}, \bigoplus_{n \in \mathbb{N}} \mathbb{Z} \right) \cong 0.$$

Thus the only  $\mathbb{Z}$ -linear map from  $\mathbb{Q}$  to  $\bigoplus_{n \in \mathbb{N}} \mathbb{Z}$  is the zero map.  $\square$

#### 10.5 Base Change

**Proposition 10.5.** *Let  $R \rightarrow S$  be a flat ring map. If  $E$  is an injective  $S$ -module, then  $E$  is injective as an  $R$ -module.*

*Proof.* This is true because  $\mathrm{Hom}_R(M, E) = \mathrm{Hom}_S(M \otimes_R S, E)$  and the fact that tensoring with  $S$  is exact.  $\square$

#### 10.6 Local Criteria for Flatness

In this section we give criteria for flatness over local rings. We shall weaken the condition  $\mathrm{Tor}_1^R(R/I, M) = 0$  for all  $I \subset R$  to just  $\mathrm{Tor}_1^R(R/\mathfrak{m}, M) = 0$  for  $\mathfrak{m}$  the maximal ideal.

**Proposition 10.6.** *Let  $M$  be an  $R$ -module. The following conditions are equivalent:*

1.  $M$  is a flat  $R$ -module.
2.  $M_{\mathfrak{p}}$  is a flat  $A_{\mathfrak{p}}$ -module for all prime ideals  $\mathfrak{p}$ .
3.  $M_{\mathfrak{m}}$  is a flat  $A_{\mathfrak{m}}$ -module for all maximal ideals  $\mathfrak{m}$ .

*Proof.*

(1  $\implies$  2): Let  $\mathbf{A}\text{-Mod}$  denote the category of  $A$ -modules and let  $\mathbf{A}_{\mathfrak{p}}\text{-Mod}$  denote the category of  $A_{\mathfrak{p}}$ -modules. Then localization is full as a functor. In particular, every injective map of  $A_{\mathfrak{p}}$ -modules has the form  $\varphi_{\mathfrak{p}} : N_{\mathfrak{p}} \rightarrow L_{\mathfrak{p}}$ , where  $N$  and  $L$  are  $A$ -modules and  $\varphi$  is an injective map  $A$ -linear map from  $N$  to  $L$ . The map  $i \otimes 1 : N \otimes_A M \rightarrow L \otimes_A M$  is also injective since  $M$  is flat as an  $A$ -module. Since localization is exact as a functor and commutes with tensor products, we have  $i_{\mathfrak{p}} \otimes 1 : N_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}} \rightarrow L_{\mathfrak{p}} \otimes_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$  is an injective map of  $A_{\mathfrak{p}}$ -modules. Therefore  $M_{\mathfrak{p}}$  is flat as an  $A_{\mathfrak{p}}$ -module.

(2  $\implies$  3): Trivial.

(3  $\implies$  1): Let  $\varphi$  denote the inclusion map  $I \subset A$  be an ideal. We will show that  $\text{Ker}(1 \otimes \varphi) = 0$  by showing  $\text{Ker}(1 \otimes \varphi)_{\mathfrak{m}} = 0$  for all maximal ideals  $\mathfrak{m} \subset A$ . Suppose  $\mathfrak{m} \subset A$  is an arbitrary maximal ideal. By hypothesis,  $M_{\mathfrak{m}}$  is a flat  $A_{\mathfrak{m}}$ -module. Since localization is exact as functor, the map  $\varphi_{\mathfrak{m}} : I_{\mathfrak{m}} \subset A_{\mathfrak{m}}$  is injective, and since  $M_{\mathfrak{m}}$  is flat as an  $A_{\mathfrak{m}}$ -module, the map  $1 \otimes \varphi_{\mathfrak{m}} : I_{\mathfrak{m}} \otimes_{A_{\mathfrak{m}}} M_{\mathfrak{m}} \rightarrow I_{\mathfrak{m}} \otimes_{A_{\mathfrak{m}}} M_{\mathfrak{m}}$  is injective as well. Therefore

$$\begin{aligned} 0 &\cong \text{Ker}(1 \otimes \varphi_{\mathfrak{m}}) \\ &= \text{Ker}((1 \otimes \varphi)_{\mathfrak{m}}) \\ &= \text{Ker}(1 \otimes \varphi)_{\mathfrak{m}}, \end{aligned}$$

which proves the claim.  $\square$

**Theorem 10.4.** Let  $(A, \mathfrak{m})$  and  $(B, \mathfrak{n})$  be Noetherian local rings,  $B$  and  $A$ -algebra and  $\mathfrak{m}B \subset \mathfrak{n}$ . Let  $M$  be a finitely generated  $B$ -module. Then  $M$  is flat as an  $A$ -module if and only if  $\text{Tor}_1^A(A/\mathfrak{m}, M) = 0$ .

*Proof.* If  $M$  is flat as an  $A$ -module, then  $\text{Tor}_1^A(A/\mathfrak{m}, M) = 0$ , by Theorem (10.1). Now assume that  $\text{Tor}_1^A(A/\mathfrak{m}, M) = 0$ . Let  $I \subset A$  be an ideal. We have to prove that  $I \otimes_A M \rightarrow M$  is injective. We first claim that  $\bigcap_{n=0}^{\infty} \mathfrak{m}^n \cdot (I \otimes_A M) = 0$ . To see this, we consider  $I \otimes_A M$  as a  $B$ -module via the  $B$ -module structure of  $M$ . It is finitely generated as a  $B$ -module, and therefore by Krull's Intersection Theorem,  $\bigcap_{n=0}^{\infty} \mathfrak{n}^n \cdot (I \otimes_A M) = 0$ . But  $\mathfrak{m}B \subset \mathfrak{n}$  implies the claim.

Let  $x \in \text{Ker}(I \otimes_A M \rightarrow M)$ . Then we will show that  $x \in \bigcap_{n=0}^{\infty} \mathfrak{m}^n \cdot (I \otimes_A M)$  for all  $n$ . To prove this, we consider the map

$$(\mathfrak{m}^n I) \otimes_A M \rightarrow I \otimes_A M.$$

The image of this map is  $\mathfrak{m}^n \cdot (I \otimes_A M)$ . Using the lemma of Artin-Rees, we obtain an integer  $s$  such that  $\mathfrak{m}^s \cap I \subset \mathfrak{m}^n I$ . Therefore, it is enough to prove that  $x$  is in the image of

$$(\mathfrak{m}^n \cap I) \otimes_A M \rightarrow I \otimes_A M$$

for all  $n$ . From the exact sequence

$$(\mathfrak{m}^n \cap I) \otimes_A M \longrightarrow I \otimes_A M \longrightarrow (I/\mathfrak{m}^n \cap I) \otimes_A M \longrightarrow 0$$

we deduce that it is sufficient to see that  $x$  maps to 0 in  $(I/\mathfrak{m}^n \cap I) \otimes_A M$ . Consider the following commutative diagram:

$$\begin{array}{ccc} I \otimes_A M & \xrightarrow{\gamma} & (I/\mathfrak{m}^n \cap I) \otimes_A M \\ \alpha \downarrow & & \downarrow \pi \\ M & \xrightarrow{\beta} & (A/\mathfrak{m}^n) \otimes_A M \end{array}$$

We know that  $\alpha(x) = 0$ . Therefore,  $\pi \circ \gamma(x) = 0$ , and it is sufficient to prove that  $\pi$  is injective. To prove this, consider the following exact sequence

$$0 \longrightarrow I/(\mathfrak{m}^n \cap I) \longrightarrow A/\mathfrak{m}^n \longrightarrow A/(I + \mathfrak{m}^n) \longrightarrow 0$$

which induces an exact sequence

$$\text{Tor}_1^A(A/(I + \mathfrak{m}^n), M) \longrightarrow (I/(\mathfrak{m}^n \cap I)) \otimes_A M \xrightarrow{\pi} (A/\mathfrak{m}^n) \otimes_A M.$$

We see that, finally, it suffices to prove that  $\text{Tor}_1^A(A/(I + \mathfrak{m}^n), M) = 0$ . But  $A/(I + \mathfrak{m}^n)$  is an  $A$ -module of finite length. Therefore, the following lemma proves the theorem.  $\square$

**Lemma 10.5.** *Let  $(A, \mathfrak{m})$  be a local ring and  $M$  an  $A$ -module such that  $\text{Tor}_1^A(A/\mathfrak{m}, M) = 0$ . Then  $\text{Tor}_1^A(P, M) = 0$  for all  $A$ -modules  $P$  of finite length.*

*Proof.* We use induction on the length. The case  $\text{length}(P) = 1$  is clear because it implies  $P = A/\mathfrak{m}$ . Let  $N \subset P$  be a proper submodule, then we obtain the exact sequence

$$\text{Tor}_1^A(N, M) \longrightarrow \text{Tor}_1^A(P, M) \longrightarrow \text{Tor}_1^A(P/N, M)$$

By the induction hypothesis,  $\text{Tor}_1^A(N, M) = 0$  and  $\text{Tor}_1^A(P/N, M) = 0$ . This implies  $\text{Tor}_1^A(P, M) = 0$ .  $\square$

## 10.7 Examples

**Example 10.4.** Let  $A = K[x, y]$ ,  $B = K[x, y, z]/\langle x - zy \rangle$ , and  $\varphi : A \rightarrow B$  be the map given by  $\varphi(x) = x$  and  $\varphi(y) = y$ . Then  $\text{Spec}(A)$  corresponds to the  $(x, y)$ -plane, and  $\text{Spec}(B)$  corresponds to the “blown up”  $(x, y)$ -plane. The map  $\varphi : A \rightarrow B$  induces a map  $\varphi^\# : \text{Spec}(B) \rightarrow \text{Spec}(A)$ . We calculate the inverse images of some points  $\mathfrak{m}_{i,j} = \langle x - i, x - j \rangle$  in  $\text{Max}(A) \subset \text{Spec}(A)$ :

$$\begin{aligned} (\varphi^\#)^{-1}(\mathfrak{m}_{0,0}) &= \langle x - zy, x, y \rangle = \langle x, y \rangle \\ (\varphi^\#)^{-1}(\mathfrak{m}_{1,0}) &= \langle x - zy, x - 1, y \rangle = \langle 1 \rangle = B \\ (\varphi^\#)^{-1}(\mathfrak{m}_{1,1}) &= \langle x - zy, x - 1, y - 1 \rangle = \langle x - 1, y - 1, z - 1 \rangle \end{aligned}$$

So there is one point which maps to  $\mathfrak{m}_{1,1}$ , no points which maps to  $\mathfrak{m}_{1,0}$ , and a whole line of points which maps to  $\mathfrak{m}_{0,0}$ .

On the other hand, if we let  $A = K[y, z]$  and  $\varphi : A \rightarrow B$  be the map given by  $\varphi(y) = y$  and  $\varphi(z) = z$ , then it's easy to see  $\varphi$  is a ring isomorphism.

**Example 10.5.** Let  $A = K[y]$ ,  $B = K[x, y]/\langle xy \rangle$ , and  $\varphi : A \rightarrow B$  be the map given by  $\varphi(y) = y$ . Then

$$\begin{aligned} (\varphi^\#)^{-1}(\mathfrak{m}_0) &= \langle xy, y \rangle = \langle y \rangle \\ (\varphi^\#)^{-1}(\mathfrak{m}_1) &= \langle xy, y - 1 \rangle = \langle x, y - 1 \rangle \end{aligned}$$

## 11 Projective Modules

**Definition 11.1.** Let  $P$  be an  $R$ -module. We say  $P$  is **projective** if for every surjective homomorphism  $\varphi: M \rightarrow N$  and for every homomorphism  $\psi: P \rightarrow N$  there exists a homomorphism  $\tilde{\psi}: P \rightarrow M$  such that  $\varphi \circ \tilde{\psi} = \psi$ . We illustrate this with the following diagram:

$$\begin{array}{ccc} & P & \\ \tilde{\psi} \swarrow & \downarrow \psi & \\ M & \xrightarrow{\varphi} & N \end{array}$$

An equivalent definition of being injective is given in the following proposition:

**Proposition 11.1.** Let  $E$  be an  $R$ -module. Then  $E$  is projective if and only if the covariant functor  $\text{Hom}_R(P, -)$  is exact.

### 11.1 Properties of Projective Modules

#### 11.1.1 Free Modules are Projective

**Proposition 11.2.** Every free  $R$ -module is projective.

*Proof.* Let  $F$  be a free  $R$ -module, let  $\varphi: M \rightarrow N$  be a surjective  $R$ -module homomorphism, and let  $\psi: F \rightarrow N$  be any  $R$ -module homomorphism. Let  $\{e_i\}_{i \in I}$  be a basis for  $F$  as a free  $R$ -module. For each  $i \in I$ , we choose a  $u_i \in M$  such that  $\varphi(u_i) = \psi(e_i)$  (such a choice is possible as  $\varphi$  is surjective). We define  $\tilde{\psi}: F \rightarrow M$  to be the unique  $R$ -module homomorphism such that

$$\tilde{\psi}(e_i) = u_i$$

for all  $i \in I$ . Then for all  $i \in I$ , we have

$$\begin{aligned} (\varphi \circ \tilde{\psi})(e_i) &= \varphi(\tilde{\psi}(e_i)) \\ &= \varphi(u_i) \\ &= \psi(e_i). \end{aligned}$$

It follows that  $\varphi \circ \tilde{\psi} = \psi$ . □

#### 11.1.2 Equivalent Conditions for being Projective

**Proposition 11.3.** Let  $P$  be an  $R$ -module. The following statements are equivalent.

1.  $P$  is projective.
2. Every short exact sequence of the form

$$0 \longrightarrow M \xrightarrow{\psi} N \xrightarrow{\varphi} P \longrightarrow 0 \tag{48}$$

is split exact.

3.  $P$  is a direct summand of a free  $R$ -module.

*Proof.* We first show 1 implies 2. Suppose  $P$  is projective. Then there exists an  $R$ -linear map  $\tilde{\psi}: P \rightarrow M$  such that  $\varphi \circ \tilde{\psi} = 1_P$ . In other words,  $\tilde{\psi}$  splits (47).

Next we show 2 implies 3. Suppose every short exact sequence of the form (47) is split exact. Let  $\varphi: F \rightarrow P$  be a surjective  $R$ -linear map from a free module  $F$  to  $P$  and let  $K$  denote the kernel of this map. For instance,  $F$  could be the free module with generators  $\delta_u$  for all  $u \in P$ , and  $\varphi: F \rightarrow P$  could be the unique  $R$ -linear map given by  $\varphi(\delta_u) = u$  for all  $u \in P$ . Then we have a short exact sequence

$$0 \longrightarrow K \longrightarrow F \longrightarrow P \longrightarrow 0$$

.This short exact sequence splits by assumption, and thus we have  $F \cong K \oplus P$ . In other words,  $P$  is a direct summand of a free  $R$ -module.

Finally we show 3 implies 1. Suppose  $P$  is a direct summand of a free  $R$ -module, say  $P \oplus K \cong F$  where  $F$  is free and  $K$  is some other  $R$ -module. Let  $\pi_1: F \rightarrow P$  be the projection map, given by

$$\pi_1(u, v) = u$$

for all  $(u, v) \in F$  and let  $\iota_1: P \rightarrow F$  be the inclusion map, given by

$$\iota_1(u) = (u, 0)$$

for all  $u \in P$ . Now we want to show that  $P$  is projective, so let  $\varphi: M \rightarrow N$  be a surjective  $R$ -linear map and let  $\psi: P \rightarrow N$  be any other  $R$ -linear map. Since  $F$  is free, it is also projective, and so there exists an  $R$ -linear map  $\phi: F \rightarrow M$  such that  $\varphi \circ \phi = \psi \circ \pi_1$ . Define  $\tilde{\psi}: P \rightarrow M$  by  $\tilde{\psi} = \phi \circ \iota_1$ . Then

$$\begin{aligned} \varphi \circ \tilde{\psi} &= \varphi \circ \phi \circ \iota_1 \\ &= \psi \circ \pi_1 \circ \iota_1 \\ &= \psi \circ 1_P \\ &= \psi. \end{aligned}$$

Thus  $P$  is projective. □

### 11.1.3 Projective Modules over Local Ring are Free

**Lemma 11.1.** *Every projective  $R$ -module is free if and only if every countably generated projective  $R$ -module is free.*

**Lemma 11.2.** *Let  $M$  be a countably generated  $R$ -module. Suppose any direct summand  $N$  of  $M$  satisfies the following property: any element of  $N$  is contained in a free direct summand of  $N$ . Then  $M$  is free.*

*Proof.* Let  $(u_n)$  be a countable sequence of generators for  $M$ . Note that  $M$  is a direct summand of itself. Since  $u_1 \in M$ , we see that it is contained in a free direct summand of  $M$ , say  $F_1$ . Write

$$M = F_1 \oplus M_1.$$

Next,  $M_1$  is a direct summand of  $M$ . If  $M_1 = 0$ , then  $M = F_1$  and we are done, so (by reindexing if necessary) we may assume that  $u_2 \notin F_1$ . Then  $u_2 \in M_1$ , and so it is contained in a free direct summand of  $M_1$ , say  $F_2$ . Write

$$\begin{aligned} M &= F_1 \oplus M_1 \\ &= F_1 \oplus F_2 \oplus M_2. \end{aligned}$$

Continuing in this manner, we construct a sequence of free  $R$ -modules  $(F_n)$  such that  $u_n \in F_n$  for all  $n$ . In particular, we have

$$M = \bigoplus_{n=1}^{\infty} F_n.$$

Therefore  $F$  is free. □

**Lemma 11.3.** *Let  $A = (a_{i,j})$  be an  $n \times n$  matrix over a local ring  $(R, \mathfrak{m})$ . If  $a_{i,i}$  is a unit for all  $i$  and  $a_{i,j}$  is a nonunit for all  $i \neq j$ , then  $\det A$  is a unit.*

*Proof.* The Leibniz formula for the determinant of  $A$  is given by

$$\det A = \sum_{\sigma \in S_n} \operatorname{sgn}(\sigma) \prod_{i=1}^n a_{i,\sigma(i)}.$$

Observe that if  $\sigma \neq 1$ , then  $\prod_{i=1}^n a_{i,\sigma(i)} \in \mathfrak{m}$ . Indeed, there exists some  $i$  such that  $\sigma(i) \neq i$ , and thus  $a_{i,\sigma(i)} \in \mathfrak{m}$  which implies the product belongs to  $\mathfrak{m}$  too. On the other hand,  $\prod_{i=1}^n a_{i,i} \in R \setminus \mathfrak{m}$  since  $R \setminus \mathfrak{m}$  is multiplicatively closed. Therefore we can express  $\det A$  as a unit plus a nonunit. This implies  $\det A$  is a unit. □

**Lemma 11.4.** *Let  $P$  be a projective module over a local ring  $R$ . Then any element of  $P$  is contained in a free direct summand of  $P$ .*

*Proof.* Since  $P$  is projective, it is a direct summand of some free  $R$ -module, say  $F = P \oplus Q$ . Let  $x \in P$  be the element we wish to show is contained in a free direct summand of  $P$ . Let  $B$  be a basis of  $F$  such that the number of basis elements needed in the expression of  $x$  is minimal, say

$$x = \sum_{i=1}^n a_i e_i$$

for some  $e_i \in B$  and  $a_i \in R$ . Then no  $a_j$  can be expressed as a linear combination of the other  $a_i$ . Indeed, if

$$a_j = \sum_{i \neq j} a_i b_i$$

for some  $b_i \in R$ , then replacing  $e_i$  by  $e_i + b_i e_j$  for  $i \neq j$  and leaving unchanged the other elements of  $B$ , we get a new basis for  $F$  in terms of which

$$\begin{aligned} x &= \sum_{i=1}^n a_i e_i \\ &= \sum_{i \neq j} a_i e_i + a_j e_j \\ &= \sum_{i \neq j} a_i e_i + \left( \sum_{i \neq j} a_i b_i \right) e_j \\ &= \sum_{i \neq j} a_i (e_i + b_i e_j) \end{aligned}$$

has a shorter expression.

For each  $i$  we decompose  $e_i$  into its  $P$  and  $Q$ -components, say

$$e_i = y_i + z_i$$

where  $y_i \in P$  and  $z_i \in Q$ . Write

$$y_i = \sum_{j=1}^n b_{ij} e_j + t_i \quad (49)$$

where  $t_i$  is a linear combination of elements in  $B$  other than  $e_1, \dots, e_n$ . To finish the proof it suffices to show that the matrix  $(b_{ij})$  is invertible. For then the map  $F \rightarrow F$  sending  $e_i \mapsto y_i$  for  $i = 1, \dots, n$  and fixing  $B \setminus \{e_1, \dots, e_n\}$  is an isomorphism, so that  $y_1, \dots, y_n$  together with  $B \setminus \{e_1, \dots, e_n\}$  form a basis for  $F$ . Then the submodule  $N$  spanned by  $y_1, \dots, y_n$  is a free submodule of  $P$ . Furthermore  $N$  is a direct summand of  $P$  since  $N \subseteq P$  and both  $N$  and  $P$  are direct summands of  $F$ . Also  $x \in N$  since  $x \in P$  implies

$$\begin{aligned} x &= \sum_{i=1}^n a_i e_i \\ &= \sum_{i=1}^n a_i y_i \end{aligned}$$

So  $N$  is a free direct summand of  $P$  which contains  $x$ .

Now we prove that  $(b_{ij})$  is invertible. Plugging (48) into

$$\sum_{i=1}^n a_i e_i = \sum_{i=1}^n a_i y_i$$

and equating coefficients gives us

$$a_j = \sum_{i=1}^n a_i b_{ij}.$$

But as noted above, our choice of  $B$  guarantees that no  $a_j$  can be written as a linear combination of the other  $a_i$ . Thus  $b_{ij}$  is a nonunit for  $i \neq j$ , and  $1 - b_{ii}$  is a nonunit, so in particular  $b_{ii}$  is a unit for all  $i$ . But a matrix over a local ring having units along the diagonal and nonunits elsewhere is invertible, as its determinant is a unit.  $\square$

**Theorem 11.5.** *If  $P$  is a projective module over a local ring, then  $P$  is free.*

#### 11.1.4 Local Conditions for being Projective

**Proposition 11.4.** *Let  $P$  be a finitely presented  $R$ -module. The following are equivalent.*

1.  $P$  is a projective  $R$ -module.
2.  $P_{\mathfrak{p}}$  is a free  $R_{\mathfrak{p}}$ -module for all prime ideals  $\mathfrak{p}$  in  $R$ .
3.  $P_{\mathfrak{m}}$  is a free  $R_{\mathfrak{m}}$ -module for all maximal ideals  $\mathfrak{m}$  in  $R$ .

Furthermore, if  $R$  is Noetherian, then these statements are also equivalent to

4. there is a finite set of elements  $a_1, \dots, a_n \in R$  that generate the unit ideal of  $R$  such that  $P_{a_i}$  is a free  $R_{a_i}$ -module for all  $i$ .

*Proof.* We first show 1 implies 2. Suppose  $P$  is a projective  $R$ -module and let  $\mathfrak{m}$  be a maximal ideal. Since  $P$  is projective, it is a direct summand of a free  $R$ -module, say

$$F = P \oplus Q.$$

Since localization commutes with direct sums, this implies

$$F_{\mathfrak{p}} = P_{\mathfrak{p}} \oplus Q_{\mathfrak{p}}.$$

Thus  $P_{\mathfrak{p}}$  is a direct summand of a free  $R_{\mathfrak{p}}$ -module. This implies  $P_{\mathfrak{p}}$  is a projective  $R_{\mathfrak{p}}$ -module. Since projective modules over local rings are free, we see that  $P_{\mathfrak{p}}$  is free.

That 2 implies 3 is clear, so we just need to show that 3 implies 1. Suppose  $P_{\mathfrak{m}}$  is a free  $R_{\mathfrak{m}}$ -module for all maximal ideals  $\mathfrak{m}$  in  $R$ . To show that  $P$  is projective, we need to show that for any surjective  $R$ -linear map  $\varphi: M \rightarrow N$ , then induced  $R$ -linear map

$$\mathrm{Hom}_R(P, \varphi): \mathrm{Hom}_R(P, M) \rightarrow \mathrm{Hom}_R(P, N)$$

is also surjective, so let  $\varphi: M \rightarrow N$  be a surjective  $R$ -linear map. Then observe that

$$\begin{aligned} \mathrm{Hom}_R(P, \varphi) \text{ is surjective} &\iff \mathrm{Hom}_R(P, N)/\mathrm{Hom}_R(P, M) \cong 0 \\ &\iff (\mathrm{Hom}_R(P, N)/\mathrm{Hom}_R(P, M))_{\mathfrak{m}} \cong 0 \text{ for all maximal ideals } \mathfrak{m} \subseteq R \\ &\iff \mathrm{Hom}_R(P, N)_{\mathfrak{m}}/\mathrm{Hom}_R(P, M)_{\mathfrak{m}} \cong 0 \text{ for all maximal ideals } \mathfrak{m} \subseteq R \\ &\iff \mathrm{Hom}_{R_{\mathfrak{m}}}(P_{\mathfrak{m}}, N_{\mathfrak{m}})/\mathrm{Hom}_{R_{\mathfrak{m}}}(P_{\mathfrak{m}}, M_{\mathfrak{m}}) \cong 0 \text{ for all maximal ideals } \mathfrak{m} \subseteq R \\ &\iff \mathrm{Hom}_{R_{\mathfrak{m}}}(P_{\mathfrak{m}}, \varphi_{\mathfrak{m}}) \text{ is surjective for all maximal ideals } \mathfrak{m} \subseteq R \end{aligned}$$

where the last if and only if is true since  $P_{\mathfrak{m}}$  is free (and hence projective) for all maximal ideals  $\mathfrak{m} \subseteq R$ .

Now we show 4 is equivalent to 1, 2, and 3 when  $R$  is Noetherian. Suppose  $R$  is Noetherian. Then since  $P$  is finite and  $R$  is Noetherian, we see that  $\mathrm{supp} P$  is finite, say

$$\mathrm{supp} P = \{\mathfrak{p}_1, \dots, \mathfrak{p}_m\}.$$

In particular, statement 2 is equivalent to  $P_{\mathfrak{p}_i}$  being a free  $R_{\mathfrak{p}_i}$ -module for all  $1 \leq i \leq m$ . □

## 11.2 Projective Dimension

**Definition 11.2.** Let  $A$  be a ring and  $M$  a finitely generated  $A$ -module. A **free resolution** of  $M$  is an exact sequence

$$\cdots \longrightarrow F_{k+1} \xrightarrow{\varphi_{k+1}} F_k \longrightarrow \cdots \longrightarrow F_1 \xrightarrow{\varphi_1} F_0 \xrightarrow{\varphi_0} M \quad (50)$$

with finitely generated free  $A$ -modules  $F_i$  for  $i \geq 0$ . We say that a free resolution has **length**  $n$  if  $F_k = 0$  for all  $k > n$  and  $n$  is minimal with this property.

If  $(A, \mathfrak{m})$  is a local ring, then a free resolution as above is called **minimal** if  $\varphi_k(F_k) \subset \mathfrak{m}F_{k-1}$  for  $k \geq 1$ , and then  $b_k(M) := \mathrm{rank}(F_k)$ ,  $k \geq 0$ , is called the  $k$ th **Betti number** of  $M$ .

*Remark.* What does the condition  $\varphi_k(F_k) \subset \mathfrak{m}F_{k-1}$  have to do with being minimal? Let  $K_i := \mathrm{Ker}(\varphi_i)$ . Then (49) breaks up into exact sequences of the form

$$F_k \xrightarrow{\varphi_k} F_{k-1} \longrightarrow K_{k-2} \longrightarrow 0 \quad (51)$$

Tensoring (50) with  $A/\mathfrak{m}$  gives us

$$F_k/\mathfrak{m}F_k \xrightarrow{\bar{\varphi}_k} F_{k-1}/\mathfrak{m}F_{k-1} \longrightarrow K_{k-2}/\mathfrak{m}K_{k-2} \longrightarrow 0 \quad (52)$$

The condition  $\varphi_k(F_k) \subset \mathfrak{m}F_{k-1}$  forces  $\dim_{A/\mathfrak{m}}(F_{k-1}/\mathfrak{m}F_{k-1}) = \dim_{A/\mathfrak{m}}(K_{k-2}/\mathfrak{m}K_{k-2}) = b_{k-1}(M)$ . Applying Nakayama's lemma shows that  $b_{k-1}(M)$  is the minimal number of generators of  $K_{k-2}$ .

**Theorem 11.6.** Let  $(A, \mathfrak{m})$  be a local Noetherian ring and  $M$  a finitely generated  $A$ -module, then  $M$  has a minimal free resolution. The rank of  $F_k$  in a minimal free resolution is independent of the resolution. If  $M$  has a minimal resolution of finite length  $n$ ,

$$0 \longrightarrow F_n \longrightarrow F_{n-1} \longrightarrow \cdots \longrightarrow F_0 \longrightarrow M \longrightarrow 0 \quad (53)$$

and if

$$0 \longrightarrow G_m \longrightarrow G_{m-1} \longrightarrow \cdots \longrightarrow G_0 \longrightarrow M \longrightarrow 0 \quad (54)$$

is any free resolution, then  $m \geq n$ .

*Proof.* Let  $u_1, \dots, u_{s_0}$  be a minimal set of generators of  $M$  and consider the surjective map  $\varphi_0: F_0 := R^{s_0} \rightarrow M$  defined by

$$\varphi_0(a_1, \dots, a_{s_0}) = \sum_{i=1}^{s_0} a_i u_i$$

for all  $(a_1, \dots, a_{s_0}) \in F_0$ . Because of Nakayama's Lemma,  $u_1, \dots, u_{s_0}$  induces a basis of the vector space  $M/\mathfrak{m}M$ , and hence  $\varphi_0$  induces an isomorphism  $\bar{\varphi}_0: F_0/\mathfrak{m}F_0 \cong M/\mathfrak{m}M$ . In particular, this implies  $\ker \varphi_0 \subset \mathfrak{m}F_0$ . Observe that  $\ker \varphi_0$  is a submodule of a finitely generated module over a Noetherian ring, hence is finitely generated. As before, we can find a surjective map  $\varphi_1: F_1 := R^{s_1} \rightarrow \ker \varphi_0$ , where  $s_1$  is the minimal number of generators of  $\ker \varphi_0$ . Continuing in this manner, we obtain a minimal free resolution for  $M$ . To show the invariance of the Betti numbers, we consider two minimal resolutions of  $M$ :

$$\cdots \xrightarrow{\varphi_{n+1}} F_n \longrightarrow \cdots \xrightarrow{\varphi_1} F_0 \xrightarrow{\varphi_0} M \longrightarrow 0 \quad (55)$$

and

$$\cdots \xrightarrow{\psi_{n+1}} G_n \longrightarrow \cdots \xrightarrow{\psi_1} G_0 \xrightarrow{\psi_0} M \longrightarrow 0 \quad (56)$$

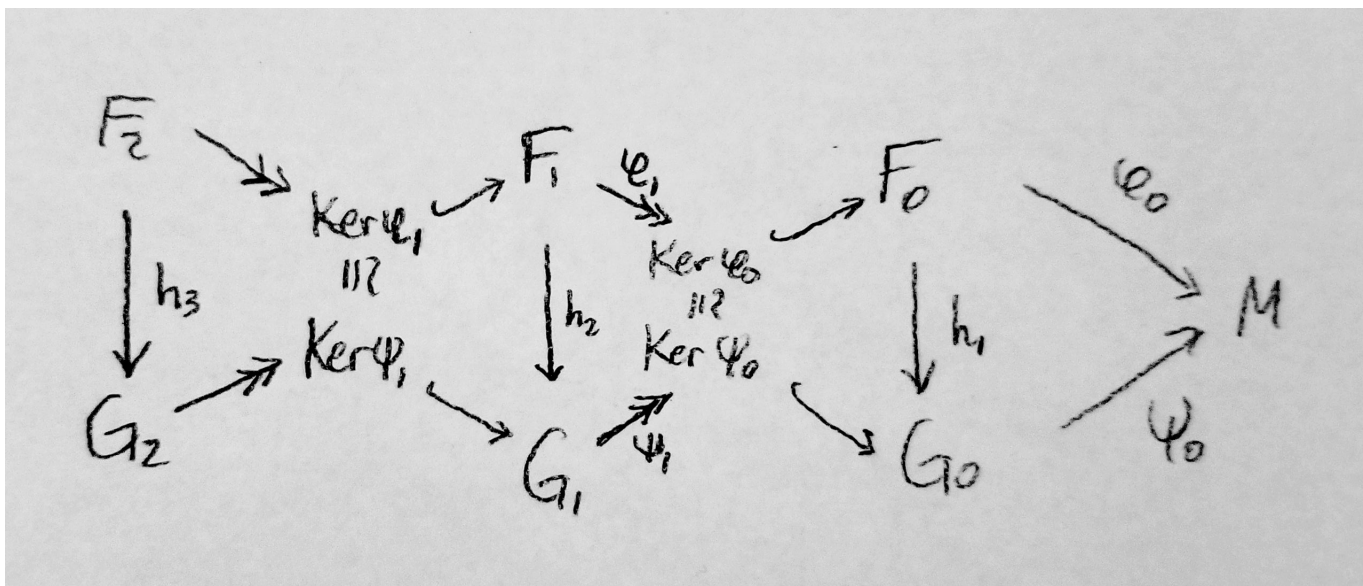

We have

$$F_0/\mathfrak{m}F_0 \cong M/\mathfrak{m}M \cong G_0/\mathfrak{m}G_0$$

and therefore  $\text{rank}(F_0) = \text{rank}(G_0)$ . Let  $\{f_1, \dots, f_{s_0}\}$ , respectively  $\{g_1, \dots, g_{s_0}\}$  be bases of  $F_0$ , respectively  $G_0$ . As  $\{\psi_0(g_i)\}$  generates  $M$ , we have

$$\varphi_0(f_i) = \sum_j a_{ij} \cdot \psi_0(g_j)$$

for some  $a_{ij} \in R$ . The matrix  $(a_{ij})$  defines a map  $\alpha_1: F_0 \rightarrow G_0$  such that  $\psi_0 \circ \alpha_1 = \varphi_0$ . The induced map  $\bar{\alpha}_1: F_0/\mathfrak{m}F_0 \rightarrow G_0/\mathfrak{m}G_0$  is an isomorphism since it is a composition of isomorphisms:  $\bar{\alpha}_1 = \bar{\psi}_0^{-1} \circ \bar{\varphi}_0$ . In particular, we derive that  $\det(a_{ij}) \neq 0 \pmod{\mathfrak{m}}$ . This implies that  $\det(a_{ij})$  is a unit in  $R$  ( $R$  is local ring) and  $\alpha_1$  is an isomorphism. Especially,  $\alpha_1$  induces an isomorphism  $\ker \varphi_0 \rightarrow \ker \psi_0$ . As  $\varphi_1$  and  $\psi_1$ , considered as matrices, have entries in  $\mathfrak{m}$ , and since we have surjections  $F_1 \rightarrow \ker \varphi_0$  and  $G_1 \rightarrow \ker \psi_0$ , it follows, as before, that  $\text{rank}(F_1) = \text{rank}(G_1)$ . Now we can continue like this and obtain the invariance of the Betti numbers.

To prove the last statement, let

$$0 \longrightarrow F_n \longrightarrow F_{n-1} \longrightarrow \cdots \longrightarrow F_0 \longrightarrow M \longrightarrow 0 \quad (57)$$

be a minimal free resolution with  $F_n \neq \langle 0 \rangle$  and

$$0 \longrightarrow G_m \longrightarrow G_{m-1} \longrightarrow \cdots \longrightarrow G_0 \longrightarrow M \longrightarrow 0 \quad (58)$$

be any free resolution. We have to prove that  $m \geq n$ . This can be proved in a similar way to the previous step. With the same idea, one can prove that there are injections  $h_i : F_i \rightarrow G_i$  for all  $i \leq n$ .  $\square$

**Definition 11.3.** A **syzygy** between  $k$  elements  $f_1, \dots, f_k$  of an  $A$ -module  $M$  is a  $k$ -tuple  $(g_1, \dots, g_k) \in A^k$  satisfying

$$\sum_{i=1}^k g_i f_i = 0.$$

The set of syzygies between  $f_1, \dots, f_k$  is a submodule of  $A^k$ . Indeed, it is the kernel of the ring homomorphism

$$\varphi : F_1 := \bigoplus_{i=1}^k A e_i \rightarrow M, \quad e_i \mapsto f_i,$$

where  $\{e_1, \dots, e_k\}$  denotes the canonical basis of  $A^k$ . The map  $\varphi$  surjects onto the  $A$ -module  $I := \langle f_1, \dots, f_k \rangle_A$  and

$$\text{syz}(I) := \text{syz}(f_1, \dots, f_k) := \text{Ker}(\varphi)$$

is called the **module of syzygies** of  $I$  with respect to the generators  $f_1, \dots, f_k$ .

**Example 11.1.** Let  $A = K[x, y, z, w]$  and let

$$\begin{aligned} f_1 &= xz - y^2 \\ f_2 &= yw - z^2 \\ f_3 &= xw - yz. \end{aligned}$$

There are three “trivial” syzygies of  $f_1, f_2$  and  $f_3$ , which are given by the 3-tuples

$$\begin{aligned} m_1 &= (f_2, -f_1, 0), \\ m_2 &= (f_3, 0, -f_1), \\ m_3 &= (0, f_3, -f_2), \end{aligned}$$

but  $\text{syz}(f_1, f_2, f_3)$  is not generated by them. A generating set for  $\text{syz}(f_1, f_2, f_3)$  is given by the 3-tuples

$$\begin{aligned} n_1 &= (w, y, -z) \\ n_2 &= (z, x, -y), \end{aligned}$$

Note that

$$\begin{aligned} f_1 &= y n_1 - z n_2, \\ f_2 &= x n_1 - y n_2, \\ f_3 &= -z n_1 + w n_2. \end{aligned}$$

*Remark.* Let  $A$  be a Noetherian local ring. If  $I = \langle f_1, \dots, f_k \rangle = \langle g_1, \dots, g_s \rangle \subset A^r$ , then it is not necessarily true that  $\text{syz}(f_1, \dots, f_k) \cong \text{syz}(g_1, \dots, g_s)$ . So why are we justified in writing  $\text{syz}(I)$ . The reason is because the modules  $\text{syz}(f_1, \dots, f_k)$  and  $\text{syz}(g_1, \dots, g_s)$  are **projectively equivalent**. This means that  $\text{syz}(f_1, \dots, f_k) \oplus A^m \cong A^n \oplus \text{syz}(g_1, \dots, g_s)$  for some free  $A$ -modules  $A^m$  and  $A^n$ . To prove this, we first need a lemma.

**Lemma 11.7.** (Schanuel’s Lemma) Let  $A$  be a Noetherian ring and  $M$  a finitely generated  $A$ -module. Moreover, assume that the following sequences are exact

$$\begin{aligned} 0 &\longrightarrow K_1 \longrightarrow A^{n_1} \xrightarrow{\pi_1} M \longrightarrow 0 \\ 0 &\longrightarrow K_2 \longrightarrow A^{n_2} \xrightarrow{\pi_2} M \longrightarrow 0 \end{aligned}$$

Then  $K_1 \oplus A^{n_2} \cong K_2 \oplus A^{n_1}$ .

*Proof.* Consider the  $A$ -module homomorphism  $\pi : A^{n_1} \oplus A^{n_2} \rightarrow M$ , given by  $\pi(a, b) = \pi_1(a) + \pi_2(b)$ . We will show that  $\text{Ker}(\pi) \cong A^{n_1} \oplus K_2$ . A similar proof will show that  $\text{Ker}(\pi) \cong K_1 \oplus A^{n_2}$ , and hence

$$A^{n_1} \oplus K_2 \cong \text{Ker}(\pi) \cong K_1 \oplus A^{n_2}.$$

Let  $e_1, \dots, e_{n_1}$  be a basis for  $A^{n_1}$  and let  $f_1, \dots, f_{n_2}$  be a basis for  $A^{n_2}$ . Since  $\pi_2$  is surjective, there exists  $a_{ij} \in A$  such that

$$\pi_1(e_i) = \sum_{j=1}^{n_2} a_{ij} \pi_2(f_j).$$

for all  $i = 1, \dots, n_1$ . Choose such  $a_{ij}$  and let  $\varphi: A^{n_1} \rightarrow A^{n_2}$  be the unique  $A$ -module homomorphism such that

$$\varphi(e_i) = \sum_{j=1}^{n_2} a_{ij} f_j$$

for all  $i = 1, \dots, n_1$ . Then  $\pi_2 \circ \varphi = \pi_1$  and the set

$$F := \{(x, -\varphi(x)) \mid x \in A^{n_1}\}$$

is an  $A$ -module which is isomorphic to  $A^{n_1}$ . Viewing  $K_2$  as

$$K_2 = \{(0, y) \mid y \in K_2\},$$

we see that  $F \cap K_2 = \{(0, 0)\}$ , so the sum  $F + K_2$  is a direct sum  $F \oplus K_2$ . Now suppose  $(x, y) \in \text{Ker}(\pi)$ . Then

$$\begin{aligned} 0 &= \pi_1(x) + \pi_2(y) \\ &= (\pi_2 \circ \varphi)(x) + \pi_2(y) \\ &= \pi_2(\varphi(x)) + \pi_2(y) \\ &= \pi_2(\varphi(x) + y), \end{aligned}$$

implies  $\varphi(x) + y \in \text{Ker}(\pi_2)$ . Moreover, we can write

$$(x, y) = (x, -\varphi(x)) + (0, \varphi(x) + y) \in F \oplus K_2 \cong A^{n_1} \oplus K_2.$$

Therefore  $\text{Ker}(\pi) \subseteq M \oplus K_2 \cong A^{n_1} \oplus K_2$ . Conversely, suppose  $(x, -\varphi(x)) + (0, y) \in M \oplus K_2$ . Applying  $\pi$  to  $(x, -\varphi(x)) + (0, y)$ , we have

$$\begin{aligned} \pi((x, -\varphi(x)) + (0, y)) &= \pi((x, y - \varphi(x))) \\ &= \pi_1(x) + \pi_2(y) - \pi_2(\varphi(x)) \\ &= \pi_1(x) - \pi_1(x) \\ &= 0. \end{aligned}$$

Therefore,  $A^{n_1} \oplus K_2 \cong M \oplus K_2 \subseteq \text{Ker}(\pi)$ . We conclude that  $\text{Ker}(\pi) \cong A^{n_1} \oplus K_2$ .  $\square$

**Corollary.** Let  $A$  be a Noetherian ring and  $M = \langle f_1, \dots, f_k \rangle = \langle g_1, \dots, g_s \rangle \subset A^r$ . Then  $\text{syzy}(f_1, \dots, f_k) \oplus A^s \cong A^r \oplus \text{syzy}(g_1, \dots, g_s)$ .

### 11.2.1 Schanuel's Lemma

**Lemma 11.8.** (Schanuel's Lemma) Let

$$0 \longrightarrow K \xrightarrow{\iota} P \xrightarrow{\pi} M \longrightarrow 0$$

and

$$0 \longrightarrow K' \xrightarrow{\iota'} P' \xrightarrow{\pi'} M \longrightarrow 0$$

be two short exact sequences of  $R$ -modules where  $P$  and  $P'$  are projective  $R$ -modules. Then there is an isomorphism

$$K \oplus P' \cong K' \oplus P.$$

*Proof.* Consider the diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & K & \xrightarrow{\iota} & P & \xrightarrow{\pi} & M \longrightarrow 0 \\ & & \downarrow \alpha & & \downarrow \beta & & \downarrow 1_M \\ 0 & \longrightarrow & K' & \xrightarrow{\iota'} & P' & \xrightarrow{\pi'} & M \longrightarrow 0 \end{array}$$

Since  $P$  is projective, there is a map  $\beta: P \rightarrow P'$  with  $\pi'\beta = \pi$ ; that is, the right square in the diagram commutes. A diagram chase shows that there is a map  $\alpha: K \rightarrow K'$  making the other square commute. This commutative diagram with exact rows gives an exact sequence

$$0 \rightarrow K \xrightarrow{\theta} P \oplus K' \xrightarrow{\psi} P' \rightarrow 0$$

where  $\theta: x \mapsto (\iota x, \alpha x)$  and  $\psi: (u, x') \mapsto \beta u - \iota' x'$  for  $x \in K$ ,  $u \in P$ , and  $x' \in K'$ . Exactness of this sequence is a straightforward calculation. This sequence splits because  $P'$  is projective.  $\square$

## 12 Associated Primes and Primary Decomposition

### 12.1 Radicals and Colon Ideals

#### 12.1.1 Radical of an Ideal

**Definition 12.1.** Let  $A$  be a ring and let  $\mathfrak{a}$  be an ideal in  $A$ . The **radical of  $\mathfrak{a}$** , denoted  $\sqrt{\mathfrak{a}}$ , is defined to be the ideal

$$\sqrt{\mathfrak{a}} := \{a \in A \mid a^n \in \mathfrak{a} \text{ for some } n \in \mathbb{N}\}.$$

We call  $\sqrt{\langle 0 \rangle}$  the **nilradical of  $A$** .

**Proposition 12.1.** Let  $A$  be a ring and let  $\mathfrak{a}$  be an ideal in  $A$ . Then

$$\sqrt{\mathfrak{a}} = \bigcap_{\substack{\mathfrak{p} \supset \mathfrak{a} \\ \text{prime}}} \mathfrak{p}.$$

*Proof.* We claim that  $\mathfrak{p} \supset \mathfrak{a}$  implies  $\mathfrak{p} \supset \sqrt{\mathfrak{a}}$ . Indeed, if  $x \in \sqrt{\mathfrak{a}}$ , then  $x^n \in \mathfrak{a} \subset \mathfrak{p}$ . But this implies  $x \in \mathfrak{p}$  since  $\mathfrak{p}$  is prime. Thus, we have

$$\sqrt{\mathfrak{a}} \subset \bigcap_{\substack{\mathfrak{p} \supset \mathfrak{a} \\ \text{prime}}} \mathfrak{p}.$$

For the reverse inclusion, we may assume that  $\mathfrak{a} = 0$  by passing to the quotient  $A/\mathfrak{a}$ . Suppose that  $x \in \bigcap_{\text{prime}} \mathfrak{p}$  but  $x^n \neq 0$  for all  $n \geq 0$ . Then  $A[x^{-1}]$  is nonzero and hence contains a prime ideal  $\mathfrak{q}$ . The preimage of  $\mathfrak{q}$  in  $A$  under the natural inclusion  $A \rightarrow A[x^{-1}]$  is a prime ideal which doesn't contain  $x$ . This is a contradiction.  $\square$

**Proposition 12.2.** Let  $A$  be a ring and let  $I, J$  be ideals in  $A$ . Then

1.  $\sqrt{I}$  is an ideal.
2. If  $I \subset J$ , then  $\sqrt{I} \subset \sqrt{J}$ .
3.  $\sqrt{I \cap J} = \sqrt{I} \cap \sqrt{J}$ .
4.  $\sqrt{I + J} = \sqrt{\sqrt{I} + \sqrt{J}}$ .

*Proof.*

1. Suppose  $a \in A$  and  $x, y \in \sqrt{I}$ , so  $x^n, y^m \in I$  for some  $n, m \in \mathbb{N}$ . Then

$$(ax + y)^{n+m} = \sum_{i=0}^{n+m} (ax)^{n+m-i} y^i. \quad (59)$$

Each term in (58) belongs to  $I$ , so  $(ax + y)^{n+m}$  belongs to  $I$ . Therefore  $ax + y$  belongs to  $\sqrt{I}$ .

2. Suppose  $a \in \sqrt{I}$ , then for some  $n \in \mathbb{N}$ , we have  $a^n \in I \subset J$ , thus  $a \in \sqrt{J}$ .
3. Suppose  $a \in \sqrt{I \cap J}$ , so  $a^n \in I \cap J$  for some  $n \in \mathbb{N}$ . Since  $a^n \in I \cap J \subset I$  and  $a^n \in I \cap J \subset J$ , we have  $a \in \sqrt{I}$  and  $a \in \sqrt{J}$ . Therefore  $\sqrt{I \cap J} \subset \sqrt{I} \cap \sqrt{J}$ . For the reverse inclusion, suppose  $a \in \sqrt{I} \cap \sqrt{J}$ , so  $a^n \in I$  and  $a^m \in J$  for some  $n, m \in \mathbb{N}$ . Then  $a^{\max(m,n)} \in I \cap J$  implies  $a \in \sqrt{I \cap J}$ . Therefore  $\sqrt{I \cap J} \supset \sqrt{I} \cap \sqrt{J}$ .
4. The inclusion  $\sqrt{I + J} \subset \sqrt{\sqrt{I} + \sqrt{J}}$  follows from the fact that  $I + J \subset \sqrt{I} + \sqrt{J}$ . For the reverse inclusion, suppose  $a \in \sqrt{\sqrt{I} + \sqrt{J}}$ . Then  $a^n = b + c$ , where  $b^m \in I$  and  $c^k \in J$  for some  $n, m, k \in \mathbb{N}$ . Then  $(a^n)^{(m+k)} \in I + J$ , and it follows that  $a \in \sqrt{I + J}$ . Thus  $\sqrt{I + J} \supset \sqrt{\sqrt{I} + \sqrt{J}}$ .

$\square$

*Remark.* Note that we do not necessarily have  $\sqrt{\bigcap_{\lambda \in \Lambda} I_\lambda} = \bigcap_{\lambda \in \Lambda} \sqrt{I_\lambda}$ . Indeed, consider  $I_n = \langle T^n \rangle$  in  $K[T]$ . Then

$$\begin{aligned} \sqrt{\bigcap_{n=1}^{\infty} \langle T^n \rangle} &= \sqrt{0} \\ &= 0 \\ &\neq \langle T \rangle. \\ &= \bigcap_{n=1}^{\infty} \langle T \rangle \\ &= \bigcap_{n=1}^{\infty} \sqrt{\langle T^n \rangle}. \end{aligned}$$

### 12.1.2 Colon Ideal

**Definition 12.2.** Let  $A$  be a ring and let  $I, J$  be ideals in  $A$ . The **colon ideal**  $I : J$  is defined as:

$$I : J = \{a \in A \mid aJ \subseteq I\}$$

*Remark.* Given  $a \in A$ , we use the shorthand notation  $I : a$  for  $I : \langle a \rangle$ .

**Proposition 12.3.** Let  $A$  be a ring,  $a, b \in A$ ,  $d$  be a nonzerodivisor in  $A$ , and let  $I, J$  be ideals in  $A$ . Then

1.  $(I \cap J) : a = (I : a) \cap (J : a)$ ,
2.  $I : \langle a, b \rangle = (I : a) \cap (I : b)$ ,
3.  $I : d = \frac{1}{d}(I \cap \langle d \rangle)$ .

*Proof.*

1. Suppose  $x \in (I \cap J) : a$ , so  $ax \in I \cap J$ . Since  $I \cap J \subset I$  and  $I \cap J \subset J$ , this implies  $x \in I : a$  and  $x \in J : a$ . Therefore  $(I \cap J) : a \subset (I : a) \cap (J : a)$ . Now suppose  $x \in (I : a) \cap (J : a)$ , then  $ax \in I$  and  $ax \in J$ , so  $x \in (I \cap J) : a$ , which means  $(I \cap J) : a \supset (I : a) \cap (J : a)$ .
2. If  $x \in A$ , then  $x\langle a, b \rangle \subset I$  if and only if  $xa \in I$  and  $xb \in I$ .
3. Omitted.

□

**Lemma 12.1.** Let  $A$  be a ring and  $I_1, I_2, I_3$  be ideals in  $A$ .

1.  $(I_1 \cap I_2) : I_3 = (I_1 : I_3) \cap (I_2 : I_3)$ , in particular  $I_1 : I_3 = (I_1 \cap I_2) : I_3$  if  $I_3 \subset I_2$ .
2.  $(I_1 : I_2) : I_3 = I_1 : (I_2 I_3)$ .
3. If  $I_1$  is prime and  $I_2 \not\subset I_1$ , then  $I_1 : I_2^j = I_1$  for  $j \geq 1$ .
4. If  $I_1 = \bigcap_{i=1}^r \mathfrak{p}_i$  with  $\mathfrak{p}_i$  prime, then  $I_1 : I_2^\infty = I_1 : I_2 = \bigcap_{I_2 \not\subset \mathfrak{p}_i} \mathfrak{p}_i$ .

*Proof.*

1. Is an easy exercise
2.  $I_1 \subset I_1 : I_2^j$  is clear. Let  $gI_2^j \subset I_1$ . Since  $I_2 \not\subset I_1$  and  $I_1$  is radical,  $I_2^j \not\subset I_1$  and we can find an  $h \in I_2^j$  such that  $h \notin I_1$  and  $gh \in I_1$ . Since  $I_1$  is prime, we have  $g \in I_1$ .

□

## 12.2 Primary Ideals

**Definition 12.3.** Let  $A$  be a ring and let  $Q \subset A$  be an ideal. We say  $Q$  is a **primary ideal** if for all  $a, b \in A$ , we have

$$ab \in Q \text{ and } a \notin Q \text{ implies } b^n \in Q \text{ for some } n \in \mathbb{N}.$$

**Proposition 12.4.** Let  $A$  be a ring and let  $Q \subset A$  be a primary ideal. Then  $\sqrt{Q}$  is a prime ideal. Moreover,  $\sqrt{Q}$  is the smallest prime ideal containing  $Q$ .

*Proof.* Suppose  $ab \in \sqrt{Q}$  and  $a \notin \sqrt{Q}$ . Then  $(ab)^m = a^m b^m \in Q$  for some  $m \in \mathbb{N}$ . Since  $a^m \notin Q$  and  $Q$  is primary,  $(b^m)^n = b^{mn} \in Q$  for some  $n \in \mathbb{N}$ . This implies  $b \in \sqrt{Q}$ . This shows that  $\sqrt{Q}$  is a prime ideal. To see that it is the smallest prime ideal, suppose  $\mathfrak{p} \subset A$  is a prime ideal such that  $Q \subset \mathfrak{p}$  and suppose  $a \in \sqrt{Q}$ . Then  $a^n \in Q \subset \mathfrak{p}$  for some  $n \in \mathbb{N}$ . Since  $\mathfrak{p}$  is a prime ideal, this implies  $a \in \mathfrak{p}$ . Therefore  $\sqrt{Q} \subset \mathfrak{p}$ .  $\square$

**Example 12.1.** The converse to Proposition (12.4) is false, that is, if  $\mathfrak{a} \subset A$  is an ideal such that  $\sqrt{\mathfrak{a}}$  is prime, then  $\mathfrak{a}$  is not necessarily primary. Indeed, let  $A = K[x, y]$  and  $\mathfrak{a} = \langle x^2, xy \rangle$ . Then  $\sqrt{\mathfrak{a}} = \langle x \rangle$  is prime, but  $\mathfrak{a}$  is not primary. We have  $xy \in \mathfrak{a}$  and  $x \notin \mathfrak{a}$ , but no power of  $y$  belongs to  $\mathfrak{a}$ .

**Definition 12.4.** Let  $A$  be a ring and let  $Q \subset A$  be a primary ideal. We denote  $\mathfrak{p} := \sqrt{Q}$  and say  $Q$  is  **$\mathfrak{p}$ -primary**.

### 12.2.1 Intersection of $\mathfrak{p}$ -Primary Ideals is Primary

**Proposition 12.5.** Let  $A$  be a ring and let  $Q_1, Q_2 \subset A$  be  $\mathfrak{p}$ -primary ideals. The  $Q_1 \cap Q_2$  is a  $\mathfrak{p}$ -primary ideal.

*Proof.* Suppose  $ab \in Q_1 \cap Q_2$  and  $a \notin Q_1 \cap Q_2$ . Then either  $a \notin Q_1$  or  $a \notin Q_2$ . Without loss of generality, assume  $a \notin Q_2$ . Then  $b^n \in Q_2$  for some  $n \in \mathbb{N}$ . Since  $\sqrt{Q_2} = \mathfrak{p}$ , we have  $b \in \mathfrak{p}$ . But since  $\mathfrak{p} = \sqrt{Q_1}$ , we also have  $b^m \in Q_1$  for some  $m \in \mathbb{N}$ . So  $b^{\gcd(m,n)} \in Q_1 \cap Q_2$ .  $\square$

*Remark.* Notice that we used the fact that these are  $\mathfrak{p}$ -primary ideals. If  $Q_1$  is  $\mathfrak{p}_1$ -primary and  $Q_2$  is  $\mathfrak{p}_2$ -primary, where  $\mathfrak{p}_1$  and  $\mathfrak{p}_2$  are different primes, then

$$\sqrt{Q_1 \cap Q_2} = \sqrt{Q_1} \cap \sqrt{Q_2} = \mathfrak{p}_1 \cap \mathfrak{p}_2,$$

which is not a prime ideal. Hence  $Q_1 \cap Q_2$  is not primary.

### 12.2.2 $\mathfrak{p}$ -primary ideals and colon properties

**Proposition 12.6.** Let  $A$  be a ring,  $\mathfrak{p} \subset A$  be a prime ideal, and  $Q \subset A$  be a  $\mathfrak{p}$ -primary ideal.

1. If  $x \notin Q$ , then  $Q : x$  is  $\mathfrak{p}$ -primary.
2. If  $x \notin \mathfrak{p}$ , then  $Q : x = Q$
3. If  $x \in Q$ , then  $Q : x = A$ .

*Proof.* 1. Suppose  $ab \in Q : x$  and  $a \notin Q : x$ . Then  $abx \in Q$  and  $ax \notin Q$  implies  $b^n \in Q$  for some  $n \in \mathbb{N}$ , since  $Q$  is primary. Therefore  $b \in Q : x$  since  $b^n x \in Q$ . To see that  $Q : x$  is  $\mathfrak{p}$ -primary, we simply note that  $a \in Q : x$  implies  $ax \in Q$  implies  $a^n \in Q$ . So  $Q \subset Q : x \subset \sqrt{Q}$ .

2. We certainly have  $Q \subset Q : x$  since  $ax \in Q$  for all  $a \in Q$ . For the reverse inclusion, suppose  $a \in Q : x$ , so  $ax \in Q$ . Assume  $a \notin Q$ . Since  $Q$  is a primary ideal, then  $ax \in Q$  and  $a \notin Q$  implies  $x^n \in Q$  for some  $n \in \mathbb{N}$ . But this implies  $x \in \mathfrak{p}$ , which is a contradiction. Hence  $a \in Q$ , and thus,  $Q : x \subset Q$ .

3. If  $a \in A$ , then  $ax \in Q$  since  $x \in Q$ . So  $A \subset Q : x$ . The reverse inclusion is obvious.  $\square$

### 12.2.3 $n$ th Symbolic Power

**Definition 12.5.** Let  $A$  be a ring and let  $\mathfrak{q}$  be a prime ideal in  $A$ . The  $n$ th symbolic power of  $\mathfrak{q}$ , denoted  $\mathfrak{q}^{(n)}$ , is defined to be the ideal

$$\mathfrak{q}^{(n)} = \mathfrak{q}^n A_{\mathfrak{q}} \cap A = \{a \in A \mid as \in \mathfrak{q}^n \text{ for some } s \in A \setminus \mathfrak{q}\}.$$

**Proposition 12.7.** Let  $A$  be a ring and let  $\mathfrak{q}$  be a prime ideal in  $A$ . Then  $\mathfrak{q}^{(n)}$  is the smallest  $\mathfrak{q}$ -primary ideal which contains  $\mathfrak{q}^n$ .

*Proof.* It is clear that  $\mathfrak{q}^n \subset \mathfrak{q}^{(n)}$ . Let us show that  $\mathfrak{q}^{(n)}$  is a  $\mathfrak{q}$ -primary ideal. Suppose  $ab \in \mathfrak{q}^{(n)}$  and  $a \notin \mathfrak{q}^{(n)}$ . Choose  $s \in A \setminus \mathfrak{q}$  such that  $abs \in \mathfrak{q}^n$ . Since  $a \in \mathfrak{q}^{(n)}$ , we must not have  $bs \in A \setminus \mathfrak{q}$ . In particular, this implies  $b \in \mathfrak{q}$  since  $A \setminus \mathfrak{q}$  is multiplicatively closed. But then  $b^n \in \mathfrak{q}^n \subset \mathfrak{q}^{(n)}$ . Thus  $\mathfrak{q}^{(n)}$  is  $\mathfrak{q}$ -primary.

Now we will show that it is the smallest  $\mathfrak{q}$ -primary ideal which contains  $\mathfrak{q}^n$ . Let  $Q$  be any  $\mathfrak{q}$ -primary ideal which contains  $\mathfrak{q}^n$  and let  $a \in \mathfrak{q}^{(n)}$ . Choose  $s \in A \setminus \mathfrak{q}$  such that  $as \in \mathfrak{q}^n \subset Q$ . Since  $A \setminus \mathfrak{q}$  is multiplicatively closed and since  $Q \cap A \setminus \mathfrak{q} = \emptyset$ , we must have  $s^m \notin Q$  for all  $m \in \mathbb{N}$ . This implies  $a \in Q$  since  $Q$  is primary. Thus  $\mathfrak{q}^{(n)} \subset Q$ .  $\square$

### 12.3 Primary Decomposition

In a Noetherian ring, any ideal can be written as a finite intersection of primary ideals (called the **primary decomposition**). Before we go over the proof, we need a definition and a lemma.

**Definition 12.6.** Let  $A$  be a ring and let  $I \subset A$  be an ideal. We say  $I$  is **irreducible** if given two ideals  $I_1, I_2 \subset A$  such that  $I = I_1 \cap I_2$ , then either  $I = I_1$  or  $I = I_2$ .

**Lemma 12.2.** Let  $A$  be a Noetherian ring and let  $I \subset A$  be an irreducible ideal. Then  $I$  is primary.

*Proof.* Suppose  $ab \in I$  with  $a \notin I$ . There is a chain of ideals:

$$I \subset I : b \subset I : b^2 \subset \dots$$

By the Noetherian condition we must have  $I : b^n = I : b^{n+1}$  for some  $n \in \mathbb{N}$ . Assume  $b^n \notin I$ . We will show  $\langle I, b^n \rangle \cap \langle I, a \rangle = I$ , which is a contradiction since  $b^n, a \notin I$ . To show this, we only need to show  $\langle b^n \rangle \cap \langle a \rangle \subset I$ . Suppose  $x \in \langle b^n \rangle \cap \langle a \rangle$ . Then  $x \in \langle a \rangle$  implies  $x = ay$  and  $x \in \langle b^n \rangle$  implies  $x = b^n z$ . Then

$$bx = b^{n+1}z = bay \in I$$

implies  $z \in I : b^{n+1} = I : b^n$ . Therefore  $x = zb^n \in I$ .  $\square$

**Theorem 12.3.** Let  $A$  be a Noetherian ring and let  $I \subset A$  be an ideal. Then  $I$  can be expressed as a finite intersection of primary ideals.

*Proof.* First, we show that  $I$  can be expressed as a finite intersection of irreducible ideals. Assume, on the contrary, that  $I$  cannot be expressed as a finite intersection of irreducible ideals. Let  $S$  be the set of all ideals which cannot be expressed as a finite intersection of irreducible ideals. Then  $S$  is nonempty since  $I \in S$ . Since  $A$  is noetherian,  $S$  has a maximal element  $J$ . Since  $J \in S$ , it must be reducible, so we can write  $J = J_1 \cap J_2$  with  $J \subsetneq J_1$  and  $J \subsetneq J_2$ . Since  $J$  is maximal, we can express  $J_1$  and  $J_2$  as a finite intersection of irreducible ideals, and hence we can express  $J$  as a finite intersection of irreducible ideals, which is a contradiction. Now apply Lemma 12.2.  $\square$

*Remark.* It is interesting to compare this proof with the proof given in my Algebraic Number Theory notes on why every ideal in  $\mathcal{O}_K$  contains a product of primes. In both cases, we needed a maximal element; one based on the index of an ideal in the ring of integers, and one based containment.

**Definition 12.7.** A primary decomposition  $I = \bigcap_{i=1}^n Q_i$  is **irredundant** if for each  $j \in \{1, \dots, n\}$

$$\bigcap_{i \neq j} Q_i \neq I.$$

*Remark.* So there are no “extraneous” factors”.

Given an irredundant primary decomposition  $I = \bigcap_{i=1}^n Q_i$ , if  $i \neq j$  then  $\mathfrak{p}_i \neq \mathfrak{p}_j$ . The reason is because if  $\mathfrak{p}_i = \mathfrak{p}_j$ , then by Proposition 12.5,  $Q = Q_i \cap Q_j$  is a smaller primary ideal which contains  $I$ , and hence the primary decomposition for  $I$  can be replaced by removing  $Q_i$  and  $Q_j$  and replacing them with  $Q$ , which means  $I = \bigcap_{i=1}^n Q_i$  is not irredundant. So we get a picture that looks like this:

**Definition 12.8.** The set of **associated primes** of  $I$ , denoted by  $\text{Ass}(I)$ , is defined as

$$\text{Ass}(I) = \{P \subset R \mid P \text{ prime}, P = I : f \text{ for some } f \in R\}$$

Given an irredundant primary decomposition  $I = \bigcap_{i=1}^n Q_i$ , we claim  $P_i \in \text{Ass}(I)$ : For any  $j$ , we can find  $f_j \notin Q_j$  but which is in all the other  $Q_i$  for  $i \neq j$ . Then

$$I : f_j = \left( \bigcap_{i=1}^n Q_i \right) : f_j = \bigcap_{i=1}^n (Q_i : f_j) = Q_j : f_j$$

Thus,  $I : f_j$  is  $P_j$ -primary. In particular  $\sqrt{I : f_j} = \sqrt{Q_j : f_j} = P_j$ . Also, if  $P = I : f$  for some  $f \in R$ , then

$$P \supset Q_1 \cap Q_2 \cap \cdots \cap Q_n$$

Since  $P$  is a prime ideal,  $P \supset Q_k$  for some  $1 \leq k \leq n$ . Then  $P \supset P_k$  since  $P_k$  is the smallest prime ideal which contains  $Q_k$ .

**Definition 12.9.** An associated prime  $P_i$  which does not properly contain any other associated prime  $P_j$  is called a **minimal** associated prime. The non-minimal associated primes are called **embedded** associated primes.

**Example 12.2.** Let  $I = \langle x^2, xy \rangle$ . Clearly  $I = \langle x^2, y \rangle \cap \langle x \rangle$ .

**Lemma 12.4.** (Splitting tool) Let  $A$  be a ring,  $I \subset A$  an ideal, and let  $I : a = I : a^2$  for some  $a \in A$ . Then  $I = (I : a) \cap \langle I, a \rangle$ .

*Proof.* Since both  $I : a$  and  $\langle I, a \rangle$  contain  $I$ , we have  $I \subset (I : a) \cap \langle I, a \rangle$ . For the reverse inclusion, let  $f \in (I : a) \cap \langle I, a \rangle$  and let  $f = g + xa$  for some  $g \in I$ . Then  $af = ag + xa^2 \in I$  and, therefore,  $xa^2 \in I$ . That is,  $x \in I : a^2 = I : a$  which implies  $xa \in I$  and, consequently,  $f \in I$ .  $\square$

**Example 12.3.** Let  $I = \langle xy^2, y^3 \rangle$ . Then  $I : x = \langle y^2 \rangle = I : x^2$ . Therefore,  $I = \langle y^2 \rangle \cap \langle x, y^3 \rangle$ .

**Example 12.4.** Let  $I = \langle wx, wy, wz, vx, vy, vz, ux, uy, uz, y^3 - x^2 \rangle$ . Then  $I : w = \langle x, y, z \rangle = I : w^2$ . Therefore  $I = \langle x, y, z \rangle \cap I_1$  where  $I_1 = \langle w, vx, vy, vz, ux, uy, uz, y^3 - x^2 \rangle$ . Then  $I_1 : v = \langle w, x, y, z \rangle = I_1 : v^2$ , and so  $I_1 = \langle w, x, y, z \rangle \cap I_2$  where  $I_2 = \langle w, v, ux, uy, uz, y^3 - x^2 \rangle$ . Finally,  $I_2 : u = \langle w, v, x, y, z \rangle = I_2 : u^2$ , and so  $I_2 = \langle w, v, x, y, z \rangle \cap \langle w, v, u, y^3 - x^2 \rangle$ . So  $I = \langle x, y, z \rangle \cap \langle w, x, y, z \rangle \cap \langle w, v, x, y, z \rangle \cap \langle w, v, u, y^3 - x^2 \rangle = \langle x, y, z \rangle \cap \langle w, v, u, y^3 - x^2 \rangle$ .

**Example 12.5.** Let  $A = K[x, y, z, w]$ . The twisted cubic is the set-theoretic intersection of  $xz - y^2$  and  $z(yw - z^2) - w(xw - yz)$ , but it is not a scheme-theoretic or ideal-theoretic complete intersection. To get a sense of why this is, we compute a primary decomposition of  $I = \langle xz - y^2, z(yw - z^2) - w(xw - yz) \rangle$ . Using Singular, we see that  $I$  is  $\mathfrak{p}$ -primary where  $\mathfrak{p} = \langle xz - y^2, yw - z^2, xw - yz \rangle$ , and thus  $\sqrt{I} = \mathfrak{p}$ . Therefore  $\mathbf{V}(I) = \mathbf{V}(\mathfrak{p})$ . On the other hand,  $I \subsetneq \mathfrak{p}$ .

**Definition 12.10.** Let  $A$  be a Noetherian ring and let  $I$  be an ideal in  $A$ .

1. The set of **associated primes** of  $I$ , denoted by  $\text{Ass}(I)$ , is defined as

$$\text{Ass}(I) = \{ \mathfrak{p} \subset A \mid \mathfrak{p} \text{ is prime and } \mathfrak{p} = I : a \text{ for some } a \in A \}.$$

Elements of  $\text{Ass}(\langle 0 \rangle)$  are also called **associated primes** of  $A$ .

2. Let  $\mathfrak{p}, \mathfrak{q} \in \text{Ass}(I)$  and  $\mathfrak{q} \subset \mathfrak{p}$ . Then  $\mathfrak{p}$  is called an **embedded prime ideal** of  $I$ . We define  $\text{Ass}(I, \mathfrak{p}) := \{ \mathfrak{q} \mid \mathfrak{q} \in \text{Ass}(I) \text{ and } \mathfrak{q} \subset \mathfrak{p} \}$ .
3.  $I$  is called **equidimensional** or **pure dimensional** if all associated primes of  $I$  have the same dimension.
4.  $I$  is a **primary ideal** if, for any  $a, b \in A$ ,  $ab \in I$ , and  $a \notin I$ , then  $b \in \sqrt{I}$ . Let  $\mathfrak{p}$  be a prime ideal. Then a primary ideal  $I$  is called  $\mathfrak{p}$ -primary if  $\mathfrak{p} = \sqrt{I}$ .
5. A **primary decomposition** of  $I$ , that is, a decomposition  $I = Q_1 \cap \cdots \cap Q_s$  with  $Q_i$  primary ideals, is called **irredundant** if no  $Q_i$  can be omitted in the decomposition and if  $\sqrt{Q_i} \neq \sqrt{Q_j}$  for all  $i \neq j$ .

## 12.4 Examples

**Example 12.6.** Let  $A = K[x, y]$  and  $I = \langle x^2, xy \rangle$ . Then a primary decomposition of  $I$  is given by  $I = I_1 \cap I_2$ , where

$$\begin{aligned} I_1 &= \langle x^2, y \rangle & \sqrt{I_1} &= \langle x, y \rangle \\ I_2 &= \langle x \rangle & \sqrt{I_2} &= \langle x \rangle \end{aligned}$$

**Example 12.7.** Let  $A = K[x, y, u, v]$  and  $I = \langle xu, xv, yu, yv \rangle$ . Then a primary decomposition of  $I$  is given by  $I = I_1 \cap I_2$ , where

$$\begin{aligned} I_1 &= \langle x, y \rangle & \sqrt{I_1} &= \langle x, y \rangle \\ I_2 &= \langle u, v \rangle & \sqrt{I_2} &= \langle u, v \rangle \end{aligned}$$

**Example 12.8.** Let  $A = K[x, y, u, v]$  and  $I = \langle xu, yv, xv + yu \rangle$ . Then a primary decomposition of  $I$  is given by  $I = I_1 \cap I_2 \cap I_3$ , where

$$\begin{aligned} I_1 &= \langle x, y \rangle & \sqrt{I_1} &= \langle x, y \rangle \\ I_2 &= \langle u, v \rangle & \sqrt{I_2} &= \langle u, v \rangle \\ I_3 &= \langle x^2, xy, xu, yu + xv, y^2, yv, u^2, uv, v^2 \rangle & \sqrt{I_3} &= \langle x, y, u, v \rangle \end{aligned}$$

**Example 12.9.** Let  $A = K[x, y, u, v]$  and  $I = \langle xu + yv, xv + yu \rangle$ . Then a primary decomposition of  $I$  is given by  $I = I_1 \cap I_2 \cap I_3 \cap I_4$ , where

$$\begin{aligned} I_1 &= \langle x, y \rangle & \sqrt{I_1} &= \langle x, y \rangle \\ I_2 &= \langle u, v \rangle & \sqrt{I_2} &= \langle u, v \rangle \\ I_3 &= \langle x + y, u - v \rangle & \sqrt{I_3} &= \langle x + y, u - v \rangle \\ I_4 &= \langle x - y, u + v \rangle & \sqrt{I_4} &= \langle x - y, u + v \rangle \end{aligned}$$

**Example 12.10.** Let  $R = K[x, y]$  and let  $I = \langle x^2 - xy, xy^2 - xy \rangle$ . Using Singular, we calculate

Ring	$R = K[x, y]$
Ideal	$I = \langle x^2 - xy, xy^2 - xy \rangle$
Minimal Associated Primes	$\text{MinAss } I = \{\langle x \rangle, \langle x - 1, y - 1 \rangle\}$
Associated Primes	$\text{Ass } I = \{\langle x \rangle, \langle x, y \rangle, \langle x - 1, y - 1 \rangle\}$
Primary Decomposition	$I = \langle x \rangle \cap \langle x^2, y \rangle \cap \langle x - 1, y - 1 \rangle$

Now observe that  $\dim I = 1$  and  $y - 1$  belongs to a minimal associated prime of  $I$ , yet  $\dim(\langle I, y - 1 \rangle) = 0$ . On the other hand,  $x$  also belongs to a minimal associated prime of  $I$ , and  $\dim(\langle I, x \rangle) = 1$ . The difference between  $y - 1$  and  $x$  here is that  $y - 1$  belongs to the minimal associated prime  $\langle x - 1, y - 1 \rangle$  whereas  $x$  belongs to the minimal associated prime  $\langle x \rangle$ .

Now if we localize at the maximal ideal  $\mathfrak{m} = \langle x, y \rangle$ , then the table above transforms as follows:

Ring	$R_{\mathfrak{m}} = K[x, y]_{\langle x, y \rangle}$
Ideal	$I_{\mathfrak{m}} = \langle x^2, xy \rangle$
Minimal Associated Primes	$\text{MinAss } I = \{\langle x \rangle\}$
Associated Primes	$\text{Ass } I = \{\langle x \rangle, \langle x, y \rangle\}$
Primary Decomposition	$I = \langle x \rangle \cap \langle x^2, y \rangle$

What happened here is that we now have  $\langle x - 1, y - 1 \rangle_{\mathfrak{m}} = R_{\mathfrak{m}}$ , since both  $x - 1$  and  $y - 1$  are units. Thus it is becomes an irrelevant factor.

## 12.5 Associated Primes

**Definition 12.11.** Let  $R$  be a ring,  $\mathfrak{p} \subset R$  a prime ideal, and  $M$  an  $R$ -module. We say  $\mathfrak{p}$  is an **associated prime** of  $M$  if  $\mathfrak{p} = 0 : u$  for some  $u \in M$ . The set of all associated primes of  $M$  is written  $\text{Ass}(M)$ .

**Theorem 12.5.** Let  $A$  be a Noetherian ring and let  $M$  be a finitely generated  $A$ -module.

1.  $\text{Ass}(M)$  is a finite, nonempty set of primes, each containing  $\text{Ann}(M)$ . The set  $\text{Ass}(M)$  includes all primes minimal among primes containing  $\text{Ann}(M)$ .
2. The union of associated primes of  $M$  consists of 0 and the set of zerodivisors on  $M$ .
3. The formation of the set  $\text{Ass}(M)$  commutes with localization at an arbitrary multiplicatively closed set, in the sense that

$$\text{Ass}_{S^{-1}A}(S^{-1}M) = \{S^{-1}\mathfrak{p} \mid \mathfrak{p} \in \text{Ass}(M) \text{ and } \mathfrak{p} \cap S = \emptyset\}.$$

**Lemma 12.6.** (Prime Avoidance) If  $I \subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ , with  $\mathfrak{p}_i$  prime, then  $I \subseteq \mathfrak{p}_i$  for some  $i$ .

*Proof.* We prove the contrapositive:  $I \not\subseteq \mathfrak{p}_i$  for all  $i$  implies  $I \not\subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ . Induct on  $n$ , the base case is trivial. We now suppose that  $I \not\subseteq \mathfrak{p}_i$  for all  $i$  and  $I \subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ , and arrive at a contradiction. From our inductive hypothesis, for each  $i$ ,  $I \not\subseteq \bigcup_{j \neq i} \mathfrak{p}_j$ . In particular, for each  $i$  there is an  $x_i$  which is in  $I$  but is not in  $\bigcup_{j \neq i} \mathfrak{p}_j$ . Notice that if  $x_i \notin \mathfrak{p}_i$  then  $x_i \notin \bigcup_{j=1}^n \mathfrak{p}_j$ , and we have an immediate contradiction. So suppose for every  $i$  that  $x_i \in \mathfrak{p}_i$ . Consider the element

$$x = \sum_{i=1}^n x_1 \cdots \hat{x}_i \cdots x_n.$$

By construction,  $x \in I$ . We claim that  $x \notin \bigcup_{i=1}^n \mathfrak{p}_i$ . To see this, observe that  $x_1 \cdots \hat{x}_i \cdots x_n \notin \mathfrak{p}_i$ , because for each index  $k \neq i$ ,  $x_k$  is not in  $\bigcup_{j \neq k} \mathfrak{p}_j$ , so in particular is not in  $\mathfrak{p}_i$ . Since  $\mathfrak{p}_i$  is prime, this proves that  $x_1 \cdots \hat{x}_i \cdots x_n \notin \mathfrak{p}_i$ . But every other monomial of  $x$  is in  $\mathfrak{p}_i$ , since every other monomial contains  $x_i$ . This shows that  $x \notin \mathfrak{p}_i$  for any  $i$ , hence  $x \notin \bigcup_{j=1}^n \mathfrak{p}_j$ , a contradiction.  $\square$

Finitely generated modules over Noetherian rings are distinguished for two reasons:

1. Every zerodivisor of  $M$  is contained in an associated prime ideal: Let  $x$  be a nonzerodivisor of  $M$ . This means there is a nonzero  $m \in M$  such that  $xm = 0$ . Then  $x$  belongs to the ideal  $0 : m = \{a \in A \mid am = 0\}$ . In a Noetherian ring, we have primary decomposition. So

$$x \in 0 : m = Q_1 \cap Q_2 \cap \cdots \cap Q_k \subseteq \mathfrak{p}_1 \cap \mathfrak{p}_2 \cap \cdots \cap \mathfrak{p}_k$$

where each  $\mathfrak{p}_i = (0 : m) : d_i = 0 : d_i m$  for some  $d_i \in A$ . That is, each  $\mathfrak{p}_i$  is an associated prime ideal of  $M$ .

2. The number of associated prime ideals of  $M$  is finite. So if  $I$  is an ideal which consists of zero-divisors of  $M$ , then

$$I \subseteq \bigcup_{\mathfrak{p} \in \text{Ass}(M)} \mathfrak{p}.$$

and by the Lemma (13.1), we must have  $I \subseteq \mathfrak{p}_i$  for some  $i$ . Writing  $\mathfrak{p}_i = 0 : m_i$ , the assignment  $1 \mapsto m_i$  induces a non-zero homomorphism  $\varphi : A/I \rightarrow M$ .

**Example 12.11.** Let  $A = K[x, y]$  and  $M = K[x, y]/\langle xy \rangle$ . Then  $\text{Ass}(M) = \{\langle x \rangle, \langle y \rangle\}$  and  $\text{Supp}(M) = \mathbf{V}(\langle xy \rangle)$ . Clearly  $\text{Supp}(M)$  is much bigger than  $\text{Ass}(M)$ . For example,  $\langle x - a, y \rangle \in \text{Supp}(M)$  but  $\langle x - a, y \rangle \notin \text{Ass}(M)$  for all  $a \in K$ . Consider the filtration

$$0 = M_0 \subset M_1 \subset M_2 \subset M_3 = M,$$

where  $M_1 = \langle x \rangle / \langle xy \rangle$  and  $M_2 = \langle x, y \rangle / \langle xy \rangle$ . The factors of this filtration are

$$\begin{aligned} M_3/M_2 &\cong K[x, y]/\langle x, y \rangle, \\ M_2/M_1 &\cong K[x, y]/\langle x \rangle, \\ M_1/M_0 &\cong K[x, y]/\langle y \rangle. \end{aligned}$$

**Proposition 12.8.** Let

$$0 \rightarrow M' \xrightarrow{\varphi} M \xrightarrow{\psi} M'' \rightarrow 0$$

be a short exact sequence of  $R$ -modules. Then

$$\text{Ass}(M') \subset \text{Ass}(M) \subset \text{Ass}(M') \cup \text{Ass}(M'')$$

*Proof.* We first show  $\text{Ass}(M') \subset \text{Ass}(M)$ . Let  $\mathfrak{p} \in \text{Ass}(M')$ . Choose  $u' \in M'$  such that  $\mathfrak{p} = 0 : u'$ . We claim that  $\mathfrak{p} = 0 : \varphi(u')$ . Indeed, if  $a \in \mathfrak{p}$ , then

$$\begin{aligned} a\varphi(u') &= \varphi(au') \\ &= \varphi(0) \\ &= 0 \end{aligned}$$

implies  $a \in 0 : \varphi(u')$  and hence  $\mathfrak{p} \subset 0 : \varphi(u')$ . Conversely, if  $a \in 0 : \varphi(u')$ , then

$$\begin{aligned} 0 &= a\varphi(u') \\ &= \varphi(au') \end{aligned}$$

implies  $au' = 0$  since  $\varphi$  is injective, which implies  $a \in \mathfrak{p}$  since  $\mathfrak{p} = 0 : u'$ . Therefore  $\mathfrak{p} \supset 0 : \varphi(u')$ , and so  $\mathfrak{p} \in \text{Ass}(M)$ . This implies  $\text{Ass}(M') \subset \text{Ass}(M)$ .

We now show  $\text{Ass}(M) \subset \text{Ass}(M') \cup \text{Ass}(M'')$ . Let  $\mathfrak{p} \in \text{Ass}(M)$ . Choose  $u \in M$  such that  $\mathfrak{p} = 0 : u$ .

**Case 1:** Assume that  $Ru \cap M' \neq 0$ . Choose an nonzero element in  $Ru \cap M'$ , say  $au$  for some  $a \in R$ . Since  $au \neq 0$ , we must have  $a \notin \mathfrak{p}$  since  $0 : u = \mathfrak{p}$ . Thus

$$\begin{aligned} 0 : au &= (0 : u) : a \\ &= \mathfrak{p} : a \\ &= \mathfrak{p}, \end{aligned}$$

which implies  $\mathfrak{p} \in \text{Ass}(M')$ , hence  $\text{Ass}(M) \subset \text{Ass}(M')$ .

**Case 2:** Assume that  $Ru \cap M' = 0$ . We claim that  $\mathfrak{p} = 0 : \psi(u)$ . First note that  $\mathfrak{p} \subset 0 : \psi(u)$  follows from the argument above, so it suffices to show  $\mathfrak{p} \supset 0 : \psi(u)$ . Let  $a \in 0 : \psi(u)$ . Then

$$\begin{aligned} 0 &= a\psi(u) \\ &= \psi(au) \end{aligned}$$

implies  $au \in \ker \psi = M'$ . Since  $Ru \cap M' = 0$ , this implies  $au = 0$ , and consequently  $a \in \mathfrak{p}$ . It follows that  $\mathfrak{p} \supset 0 : \psi(u)$ .  $\square$

**Proposition 12.9.** *Let  $R$  be a Noetherian ring and let  $M$  be a finitely-generated  $R$ -module. Then there exists a finite filtration*

$$0 = M_0 \subset M_1 \subset \cdots \subset M_k = M$$

*such that the successive quotients  $M_{i+1}/M_i$  are isomorphic to various  $R/\mathfrak{p}_i$  with the  $\mathfrak{p}_i \subset R$  prime.*

*Proof.* Let  $M' \subset M$  be maximal among submodules for which such a filtration (ending with  $M'$ ) exists. We would like to show that  $M' = M$ . Now  $M'$  is well-defined since  $0$  has such a filtration and  $M$  is Noetherian.

There is a filtration

$$0 = M_0 \subset M_1 \subset \cdots \subset M_l = M' \subset M$$

where the successive quotients, *except* possibly the last  $M/M'$ , are of the form  $R/\mathfrak{p}_i$  for  $\mathfrak{p}_i$  prime. If  $M' = M$ , we are done. Otherwise, consider the quotient  $M/M' \neq 0$ . There is an associated prime of  $M/M'$ . So there is a prime  $\mathfrak{p}$  which is the annihilator of  $x \in M/M'$ . This means that there is an injection

$$R/\mathfrak{p} \hookrightarrow M/M'.$$

Now, take  $M_{l+1}$  as the inverse image in  $M$  of  $R/\mathfrak{p} \subset M/M'$ . Then we can consider the finite filtration

$$0 = M_0 \subset M_1 \subset \cdots \subset M_{l+1},$$

all of whose successive quotients are of the form  $R/\mathfrak{p}_i$ ; this is because  $M_{l+1}/M_l = M_{l+1}/M'$  is of this form by construction. We have thus extended this filtration one step further, a contradiction since  $M'$  was assumed to be maximal.  $\square$

## 13 Depth

### 13.0.1 Prime Avoidance

**Lemma 13.1.** (Prime Avoidance) If  $I \subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ , with  $\mathfrak{p}_i$  prime, then  $I \subseteq \mathfrak{p}_i$  for some  $i$ .

*Proof.* We prove the contrapositive:  $I \not\subseteq \mathfrak{p}_i$  for all  $i$  implies  $I \not\subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ . Induct on  $n$ , the base case is trivial. We now suppose that  $I \not\subseteq \mathfrak{p}_i$  for all  $i$  and  $I \subseteq \bigcup_{i=1}^n \mathfrak{p}_i$ , and arrive at a contradiction. From our inductive hypothesis, for each  $i$ ,  $I \not\subseteq \bigcup_{j \neq i} \mathfrak{p}_j$ . In particular, for each  $i$  there is an  $x_i$  which is in  $I$  but is not in  $\bigcup_{j \neq i} \mathfrak{p}_j$ . Notice that if  $x_i \notin \mathfrak{p}_i$  then  $x_i \notin \bigcup_{j=1}^n \mathfrak{p}_j$ , and we have an immediate contradiction. So suppose for every  $i$  that  $x_i \in \mathfrak{p}_i$ . Consider the element

$$x = \sum_{i=1}^n x_1 \cdots \hat{x}_i \cdots x_n.$$

By construction,  $x \in I$ . We claim that  $x \notin \bigcup_{i=1}^n \mathfrak{p}_i$ . To see this, observe that  $x_1 \cdots \hat{x}_i \cdots x_n \notin \mathfrak{p}_i$ , because for each index  $k \neq i$ ,  $x_k$  is not in  $\bigcup_{j \neq k} \mathfrak{p}_j$ , so in particular is not in  $\mathfrak{p}_i$ . Since  $\mathfrak{p}_i$  is prime, this proves that  $x_1 \cdots \hat{x}_i \cdots x_n \notin \mathfrak{p}_i$ . But every other monomial of  $x$  is in  $\mathfrak{p}_i$ , since every other monomial contains  $x_i$ . This shows that  $x \notin \mathfrak{p}_i$  for any  $i$ , hence  $x \notin \bigcup_{i=1}^n \mathfrak{p}_i$ , a contradiction.  $\square$

### 13.0.2 Support

**Definition 13.1.** Let  $A$  be a commutative ring and  $M$  an  $A$ -module. The **support** of  $M$ ,  $\text{supp}(M)$ , is defined by

$$\text{Supp}(M) = \{\mathfrak{p} \in \text{Spec}(A) \mid M_{\mathfrak{p}} \neq 0\}$$

**Lemma 13.2.** Let  $A$  be a ring and let  $M$  be an  $A$ -module. Then

$$\text{Supp}(M) \subset \mathbf{V}(\text{Ann}(M)).$$

If, moreover,  $M$  is finitely generated, then

$$\text{Supp}(M) \supset \mathbf{V}(\text{Ann}(M)).$$

*Proof.* Let  $\mathfrak{p} \in \text{Supp}(M)$ . To obtain a contradiction, assume  $\mathfrak{p} \not\supset \text{Ann}(M)$ . Then there exists an  $s \in \text{Ann}(M)$  such that  $s \in A \setminus \mathfrak{p}$ . But this implies  $M_{\mathfrak{p}} = 0$ , which is a contradiction. Therefore  $\mathfrak{p} \supset \text{Ann}(M)$ .

For the second part of the lemma, write the generators of  $M$  as  $m_1, \dots, m_n$ . Let  $\mathfrak{p} \supset \text{Ann}(M)$ . To obtain a contradiction, assume  $M_{\mathfrak{p}} = 0$ . Then there exists  $s_i \in A \setminus \mathfrak{p}$  such that  $s_i m_i = 0$  for all  $i$ . Then  $s_1 s_2 \cdots s_n \notin \mathfrak{p}$  since  $\mathfrak{p}$  is prime, but  $s_1 s_2 \cdots s_n \in \text{Ann}(M)$  since  $s_1 s_2 \cdots s_n m_i = 0$  for all  $i$ , which is a contradiction. Therefore  $M_{\mathfrak{p}} \neq 0$ , or in other words  $\mathfrak{p} \in \text{Supp}(M)$ .  $\square$

## 13.1 Depth

Finite modules over Noetherian rings are distinguished for two reasons: First, every zerodivisor of  $M$  is contained in an associated prime ideal. Indeed, let  $x$  be a zerodivisor of  $M$ . This means there is a nonzero  $u \in M$  such that  $xu = 0$ . Then  $x$  belongs to the ideal

$$0 :_R u = \{a \in R \mid au = 0\}.$$

In a Noetherian ring, we have primary decomposition. So

$$\begin{aligned} x &\in 0 :_R u \\ &= Q_1 \cap \cdots \cap Q_m \\ &\subseteq \mathfrak{p}_1 \cap \cdots \cap \mathfrak{p}_m, \end{aligned}$$

where

$$\begin{aligned} \mathfrak{p}_i &= (0 :_R u) : d_i \\ &= 0 :_R d_i u. \end{aligned}$$

for some  $d_i \in R$ . That is, each  $\mathfrak{p}_i$  is an associated prime ideal of  $M$ .

Secondly, the number of associated prime ideals of  $M$  is finite. So if  $I$  is an ideal which consists of zerodivisors of  $M$ , then

$$I \subseteq \bigcup_{\mathfrak{p} \in \text{Ass}(M)} \mathfrak{p}.$$

and by the Lemma (13.1), we must have  $I \subseteq \mathfrak{p}_i$  for some  $i$ . Writing  $\mathfrak{p}_i = 0 :_R u_i$ , the assignment  $1 \mapsto u_i$  induces a nonzero homomorphism  $\varphi: R/I \rightarrow M$ .

**Proposition 13.1.** *Let  $M$  and  $N$  be  $R$ -modules.*

1. *If  $\text{Ann } M$  contains an  $N$ -regular element, then  $\text{Hom}_R(M, N) = 0$ .*
2. *Conversely, if  $R$  is Noetherian, and  $M, N$  are finite, then  $\text{Hom}_R(M, N) = 0$  implies that  $\text{Ann } M$  contains an  $N$ -regular element.*

*Proof.* 1. Suppose  $\text{Ann } M$  contains an  $N$ -regular element. Choose  $x \in \text{Ann } M$  to be such an element and let  $\varphi \in \text{Hom}_R(M, N)$ . Then

$$\begin{aligned} x\varphi(u) &= \varphi(xu) \\ &= \varphi(0) \\ &= 0 \end{aligned}$$

implies  $\varphi(u) = 0$  for all  $u \in M$ . Therefore  $\varphi = 0$ .

2. Suppose  $R$  is Noetherian,  $M, N$  are finite, and  $\text{Hom}_R(M, N) = 0$ . Assume for a contradiction that  $\text{Ann } M$  consists of zerodivisors of  $N$ . Then by the remarks above,  $\text{Ann } M \subset \mathfrak{p}$  for some associated prime ideal  $\mathfrak{p}$  of  $N$ . By Lemma (13.2),  $\mathfrak{p} \in \text{Supp } M$ ; so  $M_{\mathfrak{p}} \neq 0$ . In fact, Nakayama's Lemma tells us that  $M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}} \neq 0$ . Since  $M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}}$  is just a direct sum of copies of  $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}$ , one has an epimorphism

$$M_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}.$$

Now observe that  $\mathfrak{p}R_{\mathfrak{p}} \in \text{Ass } N_{\mathfrak{p}}$ , and thus we can compose this epimorphism with a nonzero homomorphism to obtain a nonzero homomorphism,

$$M_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}.$$

Thus

$$\begin{aligned} 0 &\neq \text{Hom}_{R_{\mathfrak{p}}}(M_{\mathfrak{p}}, N_{\mathfrak{p}}) \\ &= \text{Hom}_R(M, N)_{\mathfrak{p}}, \end{aligned}$$

which is a contradiction. □

**Example 13.1.** Let  $A = \mathbb{Q}[x, y]$ ,  $N = \mathbb{Q}[x, y]/\langle x \rangle$ , and  $M = \mathbb{Q}[x, y]/\langle x^2, yx \rangle$ . Clearly there exists a nonzero morphism from  $N$  to  $M$ . For example,  $N \xrightarrow{\cdot x} M$  is a homomorphism from  $N$  to  $M$ . However, we want to construct a homomorphism from  $N$  to  $M$  using the techniques of Proposition (13.1). Set  $I := \text{Ann}(N) = \langle x \rangle$ . There are two associated primes of  $M$ , namely  $\mathfrak{p} := \langle x, y \rangle$  and  $\mathfrak{q} := \langle x \rangle$ , both contain  $I$ , and  $0 : \bar{x} = \mathfrak{p}$  and  $0 : \bar{y} = \mathfrak{q}$ . We have  $N_{\mathfrak{q}} \cong \mathbb{Q}(y)$ ,  $N_{\mathfrak{p}} \cong \mathbb{Q}[y]_{\langle y \rangle}$ ,  $A_{\mathfrak{q}}/\mathfrak{q}A_{\mathfrak{q}} \cong \mathbb{Q}(y)$ , and  $A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}} \cong \mathbb{Q}$ . The morphism  $N_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}$  is given by  $f/g \mapsto xf/g$  where  $f, g \in \mathbb{Q}[y]$  and  $g(0) \neq 0$ . The morphism  $N_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$  is given by  $f/g \mapsto yf/g$  where  $f, g \in \mathbb{Q}(y)$  and  $g \neq 0$ .

**Lemma 13.3.** *Let  $M$  and  $N$  be  $R$ -modules and let  $\mathbf{x} = x_1, \dots, x_n$  be a weak  $N$ -sequence contained in  $\text{Ann } M$ . Then*

$$\text{Hom}_R(M, N/\mathbf{x}N) \cong \text{Ext}_R^n(M, N).$$

*Proof.* We use induction on  $n$ , starting from the vacuous case  $n = 0$ . Let  $n \geq 1$ , and set  $\mathbf{x}' = x_1, \dots, x_{n-1}$ . Then the induction hypothesis implies that

$$\text{Ext}_R^{n-1}(M, N) \cong \text{Hom}_R(M, N/\mathbf{x}'N).$$

As  $x_n$  is  $(N/\mathbf{x}'N)$ -regular, we must have  $\text{Ext}_R^{n-1}(M, N/\mathbf{x}'N) = 0$  by Prop (13.1). Therefore the exact sequence

$$0 \longrightarrow N/\mathbf{x}'N \xrightarrow{\cdot x_n} N/\mathbf{x}'N \longrightarrow N/\mathbf{x}N \longrightarrow 0$$

yields an exact sequence

$$0 \longrightarrow \text{Ext}_R^{n-1}(M, N/\mathbf{x}N) \longrightarrow \text{Ext}_R^n(M, N/\mathbf{x}'N) \xrightarrow{\bar{x}_n} \text{Ext}_R^n(M, N/\mathbf{x}'N)$$

The map  $\varphi$  is multiplication by  $x_n$  inherited from  $M/\mathbf{x}'M$ : That is, after choosing an injective resolution of  $M/\mathbf{x}'M$  with modules labeled  $I_i$  and morphisms labeled  $\varphi_i : I_i \rightarrow I_{i+1}$ , then an element in  $\text{Ext}_A^n(N, M/\mathbf{x}'M)$

is represented by a map  $\psi_n : N \rightarrow I_n$  such that  $\varphi_n \circ \psi_n = 0$ . Then the map  $\varphi$  sends the representative  $\psi_n$  in  $\text{Ext}_A^n(N, M/\mathbf{x}'M)$  to the representative  $x_n\psi_n$  in  $\text{Ext}_A^n(N, M/\mathbf{x}'M)$ , but

$$\begin{aligned} (x_n\psi_n)(n) &= x_n\psi_n(n) \\ &= \psi_n(x_nn) \\ &= \psi_n(0) \\ &= 0, \end{aligned}$$

for all  $n \in N$ . Therefore  $\varphi$  is the zero map. Hence  $\psi$  is an isomorphism. It's now easy to show that we get the sequence of isomorphism:

$$\text{Hom}_A(N, M/\mathbf{x}M) \cong \text{Ext}_A^0(N, M/\mathbf{x}M) \cong \text{Ext}_A^1(N, M/\mathbf{x}'M) \cong \cdots \cong \text{Ext}_A^n(N, M)$$

□

Let  $A$  be a Noetherian ring,  $I$  an ideal,  $M$  a finite  $A$ -module with  $M \neq IM$ , and  $\mathbf{x} = x_1, \dots, x_n$  a maximal  $M$ -sequence in  $I$ . From Prop (13.1) and Lemma (13.3), we have, since  $I$  contains an  $M/\langle x_1, \dots, x_{i-1} \rangle M$ -regular element for  $i = 1, \dots, n$ ,

$$\text{Ext}_A^{i-1}(A/I, M) \cong \text{Hom}_A(A/I, M/\langle x_1, \dots, x_{i-1} \rangle M) \neq 0.$$

We have therefore proved

**Theorem 13.4.** (Rees). Let  $A$  be a Noetherian ring,  $M$  be a finite  $A$ -module, and  $I$  an ideal such that  $IM \neq M$ . Then all maximal  $M$ -sequences in  $I$  have the same length  $n$  given by

$$n = \min\{i \mid \text{Ext}_A^i(A/I, M) \neq 0\}.$$

**Definition 13.2.** Let  $A$  be a ring,  $I \subset A$  an ideal and  $M$  an  $A$ -module. If  $M \neq IM$ , then the maximal length  $n$  of an  $M$ -sequence  $a_1, \dots, a_n \in I$  is called the  $I$ -**depth** of  $M$  and denoted by  $\text{depth}(I, M)$ . If  $M = IM$  then the  $I$ -depth of  $M$  is by convention  $\infty$ . If  $(A, \mathfrak{m})$  is a local ring, then the  $\mathfrak{m}$ -depth of  $M$  is simply called the **depth** of  $M$ , that is,  $\text{depth}(M) := \text{depth}(\mathfrak{m}, M)$ .

**Example 13.2.**

1. Let  $K$  be a field and  $K[x_1, \dots, x_n]$  the polynomial ring. Then

$$\text{depth}(\langle x_1, \dots, x_n \rangle, K[x_1, \dots, x_n]) \geq n,$$

since  $x_1, \dots, x_n$  is an  $\langle x_1, \dots, x_n \rangle$ -sequence (and we shall see later that it is  $= n$ ).

2. Let  $A$  be a ring,  $I \subset A$  an ideal and  $M$  an  $A$ -module. Then the  $I$ -depth of  $M$  is 0 if and only if every element of  $I$  is a zerodivisor for  $M$ . Hence,  $\text{depth}(I, M) = 0$  if and only if  $I$  is contained in some associated prime ideal of  $M$ . In particular, for a local ring  $(A, \mathfrak{m})$ , we have  $\text{depth}(\mathfrak{m}, A/\mathfrak{m}) = 0$ .

Recall that if  $M = IM$ , then we set the  $I$ -depth of  $M$  to be  $\infty$ . This is consistent with Theorem (13.4) because  $\text{depth}(I, M) = \infty$  if and only if  $\text{Ext}_A^i(A/I, M) = 0$  for all  $i$ . For if  $IM = M$ , then  $\text{supp}(M) \cap \text{supp}(A/I) = \{\mathfrak{p} \mid \mathfrak{p} \supset I \text{ and } M_{\mathfrak{p}} \neq 0\} = \emptyset$ , by Nakayama's lemma, hence

$$\text{supp}(\text{Ext}_A^i(A/I, M)) \subset \text{supp}(M) \cap \text{supp}(A/I) = \emptyset;$$

conversely, if  $\text{Ext}_A^i(A/I, M) = 0$  for all  $i$ , then Theorem (13.4) gives  $IM = M$ .

**Proposition 13.2.** Let  $A$  be a Noetherian ring,  $I$  an ideal in  $A$ , and

$$0 \longrightarrow U \longrightarrow M \longrightarrow N \longrightarrow 0$$

an exact sequence of finite  $A$ -modules. Then

1.  $\text{depth}(I, M) \geq \min\{\text{depth}(I, U), \text{depth}(I, N)\}$ .
2.  $\text{depth}(I, U) \geq \min\{\text{depth}(I, M), \text{depth}(I, N) + 1\}$ .
3.  $\text{depth}(I, N) \geq \min\{\text{depth}(I, U) - 1, \text{depth}(I, M)\}$ .

*Proof.* Let  $k = \text{depth}(I, U)$ ,  $m = \text{depth}(I, M)$ , and  $n = \text{depth}(I, N)$ . The given exact sequence induces a long exact sequence

$$\begin{array}{c}
\cdots \longrightarrow \text{Ext}_A^{i-1}(A/I, N) \\
\downarrow \\
\text{Ext}_A^i(A/I, U) \longrightarrow \text{Ext}_A^i(A/I, M) \longrightarrow \text{Ext}_A^i(A/I, N) \\
\downarrow \\
\text{Ext}_A^{i+1}(A/I, U) \longrightarrow \cdots
\end{array}$$

From the long exact sequence above, we deduce the following:

- If  $k < n$ , then  $\text{Ext}_A^i(A/I, M) \cong \text{Ext}_A^i(A/I, N)$  for all  $i > k$ . This implies  $m = n$ .
- If  $k > n + 1$ , then  $\text{Ext}_A^i(A/I, M) \cong \text{Ext}_A^i(A/I, U)$  for all  $i > n + 1$ . This implies  $m = k$ .
- If  $k = n + 1$ , then  $\text{Ext}_A^i(A/I, M) \cong \text{Ext}_A^i(A/I, U)$  for all  $i > n + 1$ . This implies  $m \leq n$ .
- If  $k = n$ , then  $\text{Ext}_A^i(A/I, M) \cong 0$  for all  $i > n$ . Moreover,  $\text{Ext}_A^n(A/I, M) \not\cong 0$ , since  $\text{Ext}_A^n(A/I, N) \not\cong 0$  and  $\text{Ext}_A^n(A/I, U) \cong 0$ . This implies  $m = n = k$ .

□

**Proposition 13.3.** Let  $A$  be a Noetherian ring,  $I, J$  ideals of  $A$ , and  $M$  a finite  $A$ -module. Then

1.  $\text{grade}(I, M) = \inf\{\text{depth} M_{\mathfrak{p}} \mid \mathfrak{p} \supset I\}$ .
2.  $\text{grade}(I, M) = \text{grade}(\sqrt{I}, M)$ ,
3.  $\text{grade}(I \cap J, M) = \min\{\text{grade}(I, M), \text{grade}(J, M)\}$
4. If  $\mathbf{x} = x_1, \dots, x_n$  is an  $M$ -sequence in  $I$ , then  $\text{grade}(I/\langle \mathbf{x} \rangle, M/\mathbf{x}M) = \text{grade}(I, M/\mathbf{x}M) = \text{grade}(I, M) - n$ .
5. If  $N$  is a finite  $A$ -module with  $\text{supp} N = V(I)$ , then  $\text{grade}(I, M) = \inf\{i \mid \text{Ext}_A^i(N, M) \neq 0\}$ .

*Proof.*

1. It is evident from the definition that  $\text{grade}(I, M) \leq \text{grade}(\mathfrak{p}, M) \leq \text{depth} M_{\mathfrak{p}}$  for  $\mathfrak{p} \supset I$ . Suppose  $IM \neq M$  and choose a maximal  $M$ -sequence  $\mathbf{x}$  in  $I$ . Since  $I$  consists of zero-divisors of  $M/\mathbf{x}M$ , there exists  $\mathfrak{p} \in \text{Ass}(M/\mathbf{x}M)$  with  $\mathfrak{p} \supset I$ . Since  $\mathfrak{p}A_{\mathfrak{p}} \in \text{Ass}(M/\mathbf{x}M)_{\mathfrak{p}}$  and  $(M/\mathbf{x}M)_{\mathfrak{p}} \cong M_{\mathfrak{p}}/\mathbf{x}M_{\mathfrak{p}}$ , the ideal  $\mathfrak{p}A_{\mathfrak{p}}$  consists of zero-divisors of  $M_{\mathfrak{p}}/\mathbf{x}M_{\mathfrak{p}}$ , and  $\mathbf{x}$  (as a sequence in  $A_{\mathfrak{p}}$ ) is a maximal  $M_{\mathfrak{p}}$ -sequence.
2. Factor  $I$  into its primary decomposition  $I = Q_1 \cap Q_2 \cap \cdots \cap Q_k$ . Then  $\sqrt{I} = \sqrt{Q_1} \cap \sqrt{Q_2} \cap \cdots \cap \sqrt{Q_k}$ . Any prime  $\mathfrak{p}$  which contains  $I$ , must contain one of the  $\sqrt{Q_i}$ , and therefore must contain  $\sqrt{I}$ .
3. Factor  $I$  and  $J$  into their primary decompositions  $I = Q_1 \cap Q_2 \cap \cdots \cap Q_k$  and  $J = P_1 \cap P_2 \cap \cdots \cap P_{\ell}$  with corresponding primes  $\mathfrak{q}_1, \mathfrak{q}_2, \dots, \mathfrak{q}_k$  and  $\mathfrak{p}_1, \mathfrak{p}_2, \dots, \mathfrak{p}_{\ell}$  respectively. For similar reasons as above, we must have  $\text{grade}(I \cap J, M) = \text{depth} M_{\mathfrak{p}}$  for some  $\mathfrak{p} \in \{\mathfrak{q}_1, \mathfrak{q}_2, \dots, \mathfrak{q}_k, \mathfrak{p}_1, \mathfrak{p}_2, \dots, \mathfrak{p}_{\ell}\}$ .
4. Set  $\bar{A} = A/\langle \mathbf{x} \rangle$ ,  $\bar{I} = I/\langle \mathbf{x} \rangle$ , and  $\bar{M} = M/\mathbf{x}M$ . First observe that  $IM = M \iff \bar{I}\bar{M} = \bar{M} \iff \bar{I}\bar{M} = \bar{M}$ . Furthermore,  $y_1, \dots, y_n \in I$  form an  $\bar{M}$ -sequence if and only if  $\bar{y}_1, \dots, \bar{y}_n \in \bar{I}$  form such a sequence. This shows that  $\text{grade}(I/\langle \mathbf{x} \rangle, M/\mathbf{x}M) = \text{grade}(I, M/\mathbf{x}M)$ .

□

Let  $(A, \mathfrak{m})$  be Noetherian local and  $M$  a finite  $A$ -module. All the minimal elements of  $\text{Supp} M$  belong to  $\text{Ass} M$ . Therefore if  $x \in \mathfrak{m}$  is an  $M$ -regular element, then  $x \notin \mathfrak{p}$  for all minimal elements of  $\text{Supp} M$ : Suppose  $x \in \mathfrak{p}$  where  $\mathfrak{p} = 0 : m$  for some nonzero  $m \in M$ . Then  $x \in \mathfrak{p}$  implies  $xm = 0$ , which is a contradiction since  $x$  is  $M$ -regular. Therefore  $\dim M/xM \leq \dim M - 1$ : A longest chain containing  $\text{Ann} M$  must start with a minimal prime of  $\text{Supp} M$ , but a longest chain containing  $\text{Ann} M \cup \langle x \rangle$  does not start with a minimal prime of  $\text{Supp} M$ .

**Proposition 13.4.** Let  $(A, \mathfrak{m})$  be Noetherian local and  $M \neq 0$  a finite  $A$ -module. Then  $\text{depth} M \leq \dim A/\mathfrak{p}$  for all  $\mathfrak{p} \in \text{Ass} M$ .

**Lemma 13.5.** Let  $A$  be a Noetherian ring,  $M$  a finitely generated  $A$ -module, and  $I \subset A$  an ideal with  $IM \neq M$ . Then the following are equivalent:

1.  $\text{Ext}_A^i(N, M) = 0$  for all  $i < n$  and all finitely generated  $A$ -modules  $N$  with  $\text{supp}(N) \subset V(I)$ .

2.  $\text{Ext}_A^i(A/I, M) = 0$  for all  $i < n$ .
3.  $\text{Ext}_A^i(N, M) = 0$  for all  $i < n$  and some finitely generated  $A$ -module  $N$  with  $\text{supp}(N) = V(I)$ .
4.  $I$  contains an  $M$ -sequence of length  $n$ .

*Proof.* (1) implies (2) is obvious since  $\text{supp}(A/I) = V(I)$ . Also, (2) implies (3) is obvious since  $A/I$  is some finitely generated  $A$ -module with  $\text{supp}(A/I) = V(I)$ . To prove (3) implies (4), let  $n > 0$  and assume first that  $I$  contains only zero divisors of  $M$ , that is,  $I$  is contained in an associated prime ideal  $\mathfrak{p} = 0 : m$ , where  $m$  is some nonzero element in  $M$ . Then the map  $A/\mathfrak{p} \rightarrow M$ , defined by  $1 \mapsto m$ , is injective. Localizing at  $\mathfrak{p}$ , we obtain that  $\text{Hom}_{A_{\mathfrak{p}}}(k, M_{\mathfrak{p}}) \neq 0$ , where  $k = A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}}$ . Now  $\mathfrak{p} \in V(I) = \text{supp}(N)$ , that is,  $N_{\mathfrak{p}} \neq 0$ , and hence,  $N_{\mathfrak{p}}/\mathfrak{p}N_{\mathfrak{p}} = N \otimes_A k \neq 0$  (Lemma of Nakayama). This implies that  $\text{Hom}_k(N \otimes_A k, k) \neq 0$  and, therefore, we have a non-trivial  $A_{\mathfrak{p}}$ -linear map

$$N_{\mathfrak{p}} \rightarrow N \otimes_A k \rightarrow k \rightarrow M_{\mathfrak{p}},$$

that is,  $\text{Hom}(N_{\mathfrak{p}}, M_{\mathfrak{p}}) \neq 0$ . This implies that  $\text{Hom}_A(N, M) \neq 0$ , which contradicts (3) for  $i = 0$ . So we proved that  $I$  contains an  $M$ -regular element  $f$ . By assumption,  $M/IM \neq 0$ , hence if  $n = 1$  we are done. If  $n > 1$ , then we obtain from the exact sequence

$$0 \longrightarrow M \xrightarrow{f} M \longrightarrow M/fM \longrightarrow 0$$

that  $\text{Ext}_A^i(N, M/fM) = 0$  for  $i < n - 1$ . Using induction, this implies that  $I$  contains an  $(M/fM)$ -regular sequence  $f_2, \dots, f_n$ .

To prove (4) implies (1), let  $f_1, \dots, f_n \in I$  be an  $M$ -sequence and consider again the exact sequence

$$0 \longrightarrow M \xrightarrow{f_1} M \longrightarrow M/f_1M \longrightarrow 0$$

Applying the function  $\text{Ext}_A^i(N, -)$  to this sequence gives the exact sequence

$$\dots \longrightarrow \text{Ext}_A^i(N, M) \xrightarrow{f_1} \text{Ext}_A^i(N, M) \longrightarrow \text{Ext}_A^i(N, M/f_1M) \longrightarrow \dots$$

If  $n = 1$ , then we consider the first part of this sequence

$$0 \longrightarrow \text{Hom}_A(N, M) \xrightarrow{f_1} \text{Hom}_A(N, M)$$

If  $n > 1$ , then we use induction to obtain  $\text{Ext}_A^i(N, M/f_1M) = 0$  for  $i < n - 1$ . This implies

$$0 \longrightarrow \text{Ext}_A^i(N, M) \xrightarrow{f_1} \text{Ext}_A^i(N, M)$$

is exact for  $i < n$ . Now  $\text{Ext}_A^i(N, M)$  is annihilated by elements of  $\text{Ann}(N)$ . On the other hand, by assumption, we have

$$\text{supp}(N) = V(\text{Ann}(N)) \subset V(I).$$

This implies that  $I \subset \sqrt{\text{Ann}(N)}$ . Therefore, a sufficiently large power of  $f_1$  annihilates  $\text{Ext}_A^i(N, M)$ . But we already saw that  $f_1$  is a nonzerodivisor for  $\text{Ext}_A^i(N, M)$  and, consequently,  $\text{Ext}_A^i(N, M) = 0$  for  $i < n$ .  $\square$

## 14 Cohen-Macaulay Modules

**Definition 14.1.** Let  $(R, \mathfrak{m})$  be a Noetherian local ring and let  $M$  be a finitely-generated  $R$ -module. We say  $M$  is a **Cohen-Macaulay module** if  $M = 0$  or  $M \neq 0$  and

$$\text{depth } M = \dim M.$$

If  $\text{depth } M = \dim R$ , then  $M$  is called **maximal Cohen-Macaulay**. We say  $R$  is a **Cohen-Macaulay ring** if it is a Cohen-Macaulay  $R$ -module.

**Lemma 14.1.** Let  $R$  be a Noetherian local ring, let  $N$  be a finitely-generated  $R$ -module, and let  $I$  be an ideal of  $R$  such that  $IN \neq N$ , and let  $n$  be a positive integer. Then the following are equivalent:

1.  $\text{Ext}_R^i(M, N) = 0$  for all  $i < n$  and all finitely-generated  $R$ -modules  $M$  with  $\text{Supp } M \subseteq V(I)$ .
2.  $\text{Ext}_R^i(R/I, N) = 0$  for all  $i < n$ .

3.  $\text{Ext}_R^i(M, N) = 0$  for all  $i < n$  for some finitely-generated  $R$ -module  $M$  with  $\text{Supp } M = V(I)$ .

4.  $I$  contains an  $N$ -sequence of length  $n$ .

*Proof.* That  $1 \implies 2 \implies 3$  is clear. Let us prove  $3 \implies 4$ . Assume for a contradiction that  $I$  consists of zero divisors of  $N$ . We will show  $\text{Hom}_R(M, N) \neq 0$  which will contradict 3 by taking  $i = 0$ . Since  $I$  consists of zero divisors of  $N$ , we see that

$$I \subseteq \bigcup_{\mathfrak{p} \in \text{Ass } N} \mathfrak{p}.$$

It follows from the fact that  $\text{Ass } N$  is finite and prime avoidance that  $I$  be contained in some associated prime of  $N$ , say  $I \subseteq \mathfrak{p}$ . It follows that there is an injective  $R/\mathfrak{p} \hookrightarrow N$ . By localizing at  $\mathfrak{p}$  we obtain an injective  $R_{\mathfrak{p}}$ -linear map  $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} \hookrightarrow N_{\mathfrak{p}}$ . Also  $M_{\mathfrak{p}} \neq 0$  since  $\mathfrak{p} \in V(I) = \text{Supp } M$ , and by Nakayama's lemma, we must also have  $M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}} \neq 0$ . Note that  $M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}}$  is just an  $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}$ -vector space, thus we can certainly find a surjective  $(R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}})$ -linear map  $M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}} \twoheadrightarrow R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}$ , and hence an  $R_{\mathfrak{p}}$ -linear map when viewing these as  $R_{\mathfrak{p}}$ -modules. Altogether we obtain a sequence of  $R_{\mathfrak{p}}$ -linear maps

$$M_{\mathfrak{p}} \twoheadrightarrow M_{\mathfrak{p}}/\mathfrak{p}M_{\mathfrak{p}} \twoheadrightarrow R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} \hookrightarrow N_{\mathfrak{p}}.$$

In particular, we see that

$$\begin{aligned} 0 &\neq \text{Hom}_{R_{\mathfrak{p}}}(M_{\mathfrak{p}}, N_{\mathfrak{p}}) \\ &= \text{Hom}_R(M, N)_{\mathfrak{p}}, \end{aligned}$$

which is a contradiction.

Thus  $I$  must contain an  $N$ -regular element, say  $x \in I$ . By assumption,  $N/IN \neq 0$ , hence if  $n = 1$ , then we are done. Otherwise, assume  $n > 1$ . From the exact sequence

$$0 \rightarrow N \xrightarrow{x} N \rightarrow N/xN \rightarrow 0$$

we obtain a long exact sequence in  $\text{Ext}$

$$\cdots \rightarrow \text{Ext}_R^i(M, N) \rightarrow \text{Ext}_R^i(M, N/xN) \rightarrow \text{Ext}_R^{i+1}(M, N) \rightarrow \cdots,$$

which implies  $\text{Ext}_R^i(M, N/xN) = 0$  for all  $i < n - 1$ . Using induction, this implies that  $I$  contains an  $(N/xN)$ -sequence  $x_2, \dots, x_n$ . Thus  $x_1, x_2, \dots, x_n$  is an  $N$ -sequence.

Now we prove  $4 \implies 1$ . Suppose  $M$  is a finitely-generated  $R$ -modules with  $\text{Supp } M \subseteq V(I)$ . We will prove by induction on  $n$  that for any  $R$ -module  $N$ , if  $I$  contains an  $N$ -sequence of length  $n$ , then  $\text{Ext}_R^i(M, N) = 0$  for all  $i < n$ . For the base case  $n = 1$ , suppose  $x \in I$  is an  $N$ -regular element. In this case, we just need to show that  $\text{Hom}_R(M, N) = 0$ . Note that since  $\text{Supp } M = V(\text{Ann } M)$ , we see that  $V(\text{Ann } M) \subseteq V(I)$ , which implies  $\sqrt{\text{Ann } M} \supseteq I$ . In particular,  $x^k \in \text{Ann } M$  for some  $k \in \mathbb{N}$ . Thus if  $\varphi \in \text{Hom}_R(M, N)$ , then for all  $u \in M$ , we have

$$\begin{aligned} x^k \varphi(u) &= \varphi(x^k u) \\ &= \varphi(0) \\ &= 0, \end{aligned}$$

which implies  $\varphi(u) = 0$  since  $x$  is  $N$ -regular. Thus  $\varphi = 0$  and hence  $\text{Hom}_R(M, N) = 0$ .

For the induction step, suppose  $n > 1$  and suppose that for any  $R$ -module  $L$  such that  $I$  contains an  $L$ -sequence of length  $n - 1$ , we have  $\text{Ext}_R^i(M, L) = 0$  for all  $i < n - 1$ . Let  $N$  be an  $R$ -module such that  $I$  contains an  $N$ -sequence of length  $n$ , say  $x_1, \dots, x_n \in I$ . From the exact sequence

$$0 \rightarrow N \xrightarrow{x_1} N \rightarrow N/x_1N \rightarrow 0$$

we obtain a long exact sequence in  $\text{Ext}$

$$\cdots \rightarrow \text{Ext}_R^{i-1}(M, N/x_1N) \rightarrow \text{Ext}_R^i(M, N) \xrightarrow{\cdot x_1} \text{Ext}_R^i(M, N) \rightarrow \text{Ext}_R^i(M, N/x_1N) \rightarrow \cdots. \quad (60)$$

Then  $I$  contains an  $(N/x_1N)$ -sequence of length  $n - 1$ , so by induction (with  $L = N/x_1N$ ) and the exact sequence (59) we see that  $\text{Ext}_R^i(M, N) \cong 0$  for all  $i < n - 2$  and

$$0 \rightarrow \text{Ext}_R^{n-1}(M, N) \xrightarrow{\cdot x_1} \text{Ext}_R^{n-1}(M, N)$$

is exact. In particular, this means  $x_1$  is a nonzerodivisor for  $\text{Ext}_R^{n-1}(M, N)$ . At the same time however, we have  $\sqrt{\text{Ann } M} \supseteq I$ , and so a sufficiently large power of  $x_1$  annihilates  $M$ . Since  $x_1$  is  $N$ -regular, this implies  $\text{Ext}_R^{n-1}(M, N) = 0$  by the same reasoning as in the base case.  $\square$

**Lemma 14.2.** Let  $(A, \mathfrak{m})$  be a Noetherian local ring and let  $M, N$  be finitely generated  $A$ -modules different from zero, then

$$\text{Ext}_A^i(N, M) = 0 \text{ for } i < \text{depth}(M) - \dim(N).$$

*Proof.* Let  $k = \text{depth}(M)$  and  $r = \dim(N)$ . We prove the lemma by induction on  $r$ . If  $r = 0$ , then  $\text{Ann}(N)$  is  $\mathfrak{m}$ -primary, hence  $\text{supp}(N) = V(\mathfrak{m})$ . Therefore  $\text{Ext}_A^i(N, M) = 0$  for  $i < \text{depth}(M)$ , by Lemma (14.3). Now assume that  $r > 0$ . We choose a sequence  $N = N_0 \supset N_1 \supset \cdots \supset N_n = \langle 0 \rangle$  such that  $N_j/N_{j+1} \cong A/\mathfrak{p}_j$  for suitable prime ideals  $\mathfrak{p}_j$ . Now it is sufficient to prove  $\text{Ext}_A^i(N_j/N_{j+1}, M) = 0$  for all  $j$  and  $i < k - r$  because this implies  $\text{Ext}_A^i(N, M) = 0$ . Since  $\dim(N_j/N_{j+1}) \leq \dim(N)$ , we may assume that  $N = A/\mathfrak{p}$  for  $\mathfrak{p}$  a prime ideal. Since  $\dim(A/\mathfrak{p}) > 0$ , we can choose  $x \in \mathfrak{m} \setminus \mathfrak{p}$ . We consider the exact sequence

$$0 \longrightarrow A/\mathfrak{p} \xrightarrow{x} A/\mathfrak{p} \longrightarrow A/\langle \mathfrak{p}, x \rangle \longrightarrow 0$$

Now  $\dim(A/\langle \mathfrak{p}, x \rangle) < r$  implies  $\text{Ext}_A^i(A/\langle \mathfrak{p}, x \rangle, M) = 0$  for  $i < k - r + 1$  by the induction hypothesis. On the other hand, for  $i < k - r$  we have the exact sequence

$$0 \longrightarrow \text{Ext}_A^i(A/\mathfrak{p}, M) \xrightarrow{x} \text{Ext}_A^i(A/\mathfrak{p}, M) \longrightarrow \text{Ext}_A^{i+1}(A/\langle \mathfrak{p}, x \rangle, M) = 0.$$

This implies  $\text{Ext}_A^i(N, M) = x \cdot \text{Ext}_A^i(N, M)$ . Using Nakayama's Lemma, we obtain  $\text{Ext}_A^i(N, M) = 0$ .  $\square$

**Lemma 14.3.** Let  $(A, \mathfrak{m})$  be a local Cohen-Macaulay ring of dimension  $d$ ,  $M$  be a maximal Cohen-Macaulay module of finite injective dimension, and  $N$  a finitely generated module of depth  $e$ . Then

$$\text{Ext}_A^i(N, M) = 0 \text{ for } i > \text{depth}(M) - \text{depth}(N) = d - e.$$

*Proof.* We do induction on  $e$ .  $\square$

**Proposition 14.1.** Let  $(A, \mathfrak{m})$  be a Noetherian local ring and let  $M$  be a finitely generated  $A$ -module. Then  $\dim(A/\mathfrak{p}) \geq \text{depth}(M)$  for all  $\mathfrak{p} \in \text{Ass}(M)$ .

*Proof.* Let  $\mathfrak{p} \in \text{Ass}(M)$ , that is,  $\mathfrak{p} = 0 : m$  for some nonzero  $m$  in  $M$ . This implies that  $\text{Hom}(A/\mathfrak{p}, M) \neq 0$ , because  $1 \mapsto m$  defines a non-trivial homomorphism. Hence, by Lemma (14.3), we obtain  $0 \geq \text{depth}(M) - \dim(A/\mathfrak{p})$ .  $\square$

**Theorem 14.4.** Let  $(A, \mathfrak{m})$  be a Noetherian local ring,  $M \neq 0$  a finitely generated  $A$ -module, and  $x \in A$ .

1. Let  $M$  be Cohen-Macaulay. Then  $\dim(A/\mathfrak{p}) = \dim(M)$  for all  $\mathfrak{p} \in \text{Ass}(M)$ .
2. If  $\dim(M/xM) = \dim(M) - 1$ , then  $x$  is  $M$ -regular.
3. Let  $x_1, \dots, x_r \in \mathfrak{m}$  be an  $M$ -sequence. Then  $M$  is Cohen-Macaulay if and only if  $M/\langle x_1, \dots, x_r \rangle M$  is Cohen-Macaulay.
4. If  $M$  is Cohen-Macaulay, then  $M_{\mathfrak{p}}$  is Cohen-Macaulay for all prime ideal  $\mathfrak{p}$  and  $\text{depth}(\mathfrak{p}, M) = \text{depth}_{A_{\mathfrak{p}}}(M_{\mathfrak{p}})$  if  $M_{\mathfrak{p}} \neq 0$ .

*Proof.*

1. For all associated primes  $\mathfrak{p}$  of  $M$ , we have

$$\text{depth}(M) \leq \dim(A/\mathfrak{p}) \leq \dim(M).$$

Thus  $\dim(A/\mathfrak{p}) = \dim(M)$  for all  $\mathfrak{p} \in \text{Ass}(M)$  since  $\text{depth}(M) = \dim(M)$ .

2. Observe that

$$\begin{aligned} \dim(A/\langle x, \text{Ann}(M) \rangle) &= \dim(M/xM) \\ &< \dim(M) \\ &= \dim(A/\mathfrak{p}) \end{aligned}$$

implies  $x \notin \mathfrak{p}$  for all  $\mathfrak{p} \in \text{Ass}(M)$ . Therefore  $x$  is  $M$ -regular.

3. We have

$$\begin{aligned} \text{depth}(M/\langle x_1, \dots, x_r \rangle M) &= \text{depth}(M) - r \\ &= \dim(M) - r \\ &= \dim(M/\langle x_1, \dots, x_r \rangle M). \end{aligned}$$

$\square$

## 14.1 Auslander-Buchsbaum Formula

We want to prove the Auslander-Buchsbaum formula, which is of fundamental importance for modules which allow a finite projective resolution. First we need a definition and a lemma.

**Definition 14.2.** Let  $(A, \mathfrak{m})$  be a Noetherian local ring and let  $M$  be a finitely generated  $A$ -module. We say  $M$  has finite **projective dimension** if there exists an exact sequence (a free resolution)

$$0 \longrightarrow F_n \xrightarrow{\varphi_n} F_{n-1} \xrightarrow{\varphi_{n-1}} \cdots \longrightarrow F_0 \xrightarrow{\varphi_0} M \longrightarrow 0 \quad (61)$$

with finitely generated free  $A$ -modules  $F_i$ . The integer  $n$  is called the **length** of the resolution. The minimal length of a free resolution is called the **projective dimension** of  $M$ , and is denoted  $\text{pd}_A(M)$ .

**Lemma 14.5.** *Let  $(A, \mathfrak{m})$  be a Noetherian local ring and*

$$0 \longrightarrow M_1 \xrightarrow{\psi} M_2 \xrightarrow{\varphi} M_3 \longrightarrow 0$$

be an exact sequence of  $A$ -modules. Then

$$\text{depth } M_2 \geq \min(\text{depth } M_1, \text{depth } M_3).$$

*If the inequality is strict, then*

$$\text{depth}(M_1) = \text{depth}(M_3) + 1.$$

*Proof.* Assume all three modules have positive depth. First we observe that we can find a common nonzerodivisor  $f \in \mathfrak{m} \subset A$  of  $M_1, M_2, M_3$ . The reason is because the set of all zerodivisors of  $M_i$  is

$$\bigcup_{\mathfrak{p} \in \text{Ass}(M_i)} \mathfrak{p}.$$

Assume that we cannot find a common nonzerodivisor  $f \in \mathfrak{m} \subset A$  of  $M_1, M_2, M_3$ . Then this implies that

$$\bigcup_{\substack{\mathfrak{p} \in \text{Ass}(M_j) \\ j=1,2,3}} \mathfrak{p} = \mathfrak{m}.$$

Since the number associated primes is finite, we must have  $\mathfrak{m} = \mathfrak{p}$  for some  $\mathfrak{p} \in \text{Ass}(M_j)$  and  $j \in \{1, 2, 3\}$ , by prime avoidance. However this is a contradiction, since it would imply that every  $f \in \mathfrak{m}$  is a zerodivisor for  $M_j$ .

The next observation we make is that  $f$  being  $M_3$ -regular induces a short exact sequence

$$0 \longrightarrow M_1/fM_1 \xrightarrow{\bar{\psi}} M_2/fM_2 \xrightarrow{\bar{\varphi}} M_3/fM_3 \longrightarrow 0$$

Since  $- \otimes A/f$  is right exact, we only need to check that  $M_1/fM_1 \rightarrow M_2/fM_2$  is injective. Let  $\bar{m}_1 \in M_1$  such that  $\bar{\psi}(\bar{m}_1) = 0$ . Then  $\psi(m_1) = fm_2$  for some  $m_2 \in M_2$ . After applying  $\varphi$  to both sides, we have  $f\varphi(m_2) = 0$ . Since  $f$  is  $M_3$ -regular, this implies  $\varphi(m_2) = 0$ . By exactness of the sequence in the lemma, this implies  $m_2 = \psi(n_1)$  for some  $n_1 \in M_1$ . After plugging in  $\psi(n_1)$  into our original equation  $\psi(m_1) = fm_2$ , we have  $\psi(m_1 - fn_1) = 0$ . Finally, this implies  $m_1 = fn_1$ , since  $\psi$  is injective. Therefore  $\bar{m}_1 = 0$ .

Next, note that depth drops by one if we divide by  $f$ . This follows from the fact that the short exact sequence

$$0 \longrightarrow M_j \xrightarrow{\cdot f} M_j \longrightarrow M_j/fM_j \longrightarrow 0$$

induces a long exact sequence in homology

$$\begin{array}{c}
 \cdots \longrightarrow 0 \cong H_{n-1}(x_1, \dots, x_n, M_j / fM_j) \longrightarrow \cdots \\
 \downarrow \\
 H_n(x_1, \dots, x_n, M_j) \xrightarrow{\cdot f} H_n(x_1, \dots, x_n, M_j) \longrightarrow H_n(x_1, \dots, x_n, M_j / fM_j) \\
 \downarrow \\
 H_{n-1}(x_1, \dots, x_n, M_j) \xrightarrow{\cdot f} H_{n-1}(x_1, \dots, x_n, M_j) \longrightarrow H_{n-1}(x_1, \dots, x_n, M_j / fM_j) \\
 \downarrow \\
 H_{n-2}(x_1, \dots, x_n, M_j) \xrightarrow{\cdot f} H_{n-2}(x_1, \dots, x_n, M_j) \longrightarrow \cdots
 \end{array}$$

where  $\mathfrak{m} = \langle x_1, \dots, x_n \rangle$ . If  $\text{depth}(M_j) = q$ , then  $H_i(x_1, \dots, x_n, M_j) \cong 0$  for all  $i > n - q$  and  $H_{n-q}(x_1, \dots, x_n, M_j) \not\cong 0$ . The map

$$H_i(x_1, \dots, x_n, M_j) \xrightarrow{\cdot f} H_i(x_1, \dots, x_n, M_j)$$

is simply the zero map, and thus induces isomorphisms  $H_i(x_1, \dots, x_n, M_j) \cong H_{i+1}(x_1, \dots, x_n, M_j/fM_j)$  for all  $i \geq n - q$ . This implies, in particular, that  $\text{depth}(M_j/fM_j) = q - 1$ .

From all of this, we see that the proof of the lemma can be reduced to the case that the depth of one of the  $M_i$  is zero. Suppose that  $\text{depth}(M_1) = 0$ . But then  $\text{depth}(M_2) = 0$ , because any nonzerodivisor of  $M_2$  is a nonzerodivisor of  $M_1$ . The lemma is proved in this case. Now assume that  $\text{depth}(M_2) = 0$ . Suppose  $\text{depth}(M_1) > 0$  and  $\text{depth}(M_3) > 0$ . Let  $f \in \mathfrak{m} \subset A$  be a nonzerodivisor of  $M_1$  and  $M_3$ . Again, we can find such an  $f$  by prime avoidance. From the Snake Lemma we obtain that  $f$  is a nonzerodivisor for  $M_2$  too. This is a contradiction. Finally assume that  $\text{depth}(M_3) = 0$ . If  $\text{depth}(M_2) > 0$ , let  $f \in \mathfrak{m}$  be a nonzerodivisor of  $M_2$ . This is also a nonzerodivisor for  $M_1$ , and therefore  $\text{depth}(M_1) > 0$ . Using the Snake Lemma, we obtain an inclusion

$$\text{Ker}(f : M_3 \rightarrow M_3) \subset M_1/fM_1.$$

As  $\text{depth}(M_3) = 0$ , we have  $\text{Ker}(f : M_3 \rightarrow M_3) \neq 0$ . Any nonzerodivisor of  $M_1/fM_1$  would give a nonzerodivisor of  $\text{Ker}(f : M_3 \rightarrow M_3) \subset M_3$ . But this is not possible, and therefore  $\text{depth}(M_1) = 1$ .  $\square$

*Remark.* Note that the lemma says that if  $\text{depth}(M_1) > \text{depth}(M_2)$ , then we must have  $\text{depth}(M_2) = \text{depth}(M_3)$ . For if  $\text{depth}(M_2) > \text{depth}(M_3)$ , then  $\text{depth}(M_1) = \text{depth}(M_3) + 1$ . But this would contradict the fact that  $\text{depth}(M_1) > \text{depth}(M_2)$ . Similarly, if  $\text{depth}(M_3) > \text{depth}(M_2)$ , then we must have  $\text{depth}(M_2) = \text{depth}(M_1)$ . If  $\text{depth}(M_1) = \text{depth}(M_2)$ , then either  $\text{depth}(M_3) = \text{depth}(M_1) - 1$  or  $\text{depth}(M_3) = \text{depth}(M_1)$ . If  $\text{depth}(M_3) = \text{depth}(M_2)$ , then we must have  $\text{depth}(M_3) = \text{depth}(M_1)$ . In all other cases, we have  $\text{depth}(M_1) = \text{depth}(M_3) + 1$ . We summarize this in the table below.

Condition	Implication
$\text{depth}(M_1) > \text{depth}(M_2)$	$\text{depth}(M_2) = \text{depth}(M_3)$
$\text{depth}(M_1) = \text{depth}(M_2)$	$\text{depth}(M_3) = \text{depth}(M_1) - 1$ or $\text{depth}(M_2) = \text{depth}(M_1)$
$\text{depth}(M_3) \geq \text{depth}(M_2)$	$\text{depth}(M_2) = \text{depth}(M_1)$
All other cases	$\text{depth}(M_1) = \text{depth}(M_3) + 1$

We are now ready to state the Auslander-Buchsbaum Formula.

**Theorem 14.6.** (Auslander-Buchsbaum Formula) *Let  $(R, \mathfrak{m})$  be a Noetherian local ring and let  $M$  be a finitely generated  $R$ -module of finite projective dimension. Then*

$$\text{depth } M + \text{pd}_R M = \text{depth } R.$$

*Proof.* The proof is by induction on  $\text{depth } R$ . First assume  $\text{depth } R = 0$ . Then  $\mathfrak{m}$  consists of zero divisors. In particular,

$$\mathfrak{m} \subset \bigcup_{\mathfrak{p} \in \text{Ass } R} \mathfrak{p},$$

and since the number of associated primes of  $R$  is finite ( $R$  is Noetherian!), we must have  $\mathfrak{m} = \mathfrak{p}$  for some associated prime by prime avoidance. Therefore, there exists a nonzero  $x \in R$  such that  $x\mathfrak{m} = 0$ . Choose such an  $x \in R$  and let

$$0 \longrightarrow F_n \xrightarrow{\varphi_n} F_{n-1} \xrightarrow{\varphi_{n-1}} \cdots \longrightarrow F_0 \xrightarrow{\varphi_0} M \longrightarrow 0 \quad (62)$$

be a minimal free resolution of  $M$  over  $R$ . If  $n > 0$ , then by minimality of the resolution, we have

$$\begin{aligned} \varphi_n(xF_n) &= x\varphi_n(F_n) \\ &\subseteq x\mathfrak{m}F_{n-1} \\ &= 0. \end{aligned}$$

This implies  $xF_n \cong 0$  since  $\varphi_n$  is injective, and thus  $F_n \cong 0$  since  $F_n$  is free. This contradicts the minimality of the resolution. In particular, we must have  $n = 0$ , which implies  $F_0 \cong M$ . In other words, we have  $\text{pd}_R M = 0$  and  $\text{depth } M = \text{depth } R$ .

Now we assume  $\text{depth } R > 0$  and  $\text{depth } M > 0$ . Let  $x \in \mathfrak{m}$  be a nonzerodivisor of both  $M$  and  $R$  (such an element exists since both  $M$  and  $R$  have positive depth). Then the projective dimension is constant if we divide by  $f$ , that is,

$$\text{pd}_{R/x}(M/xM) = \text{pd}_R M,$$

but the depth drops by one. This is because the sequence

$$0 \longrightarrow F_n/xF_n \xrightarrow{\bar{\varphi}_n} F_{n-1}/xF_{n-1} \xrightarrow{\bar{\varphi}_{n-1}} \cdots \longrightarrow F_0/xF_0 \xrightarrow{\bar{\varphi}_0} M/fM \longrightarrow 0 \quad (63)$$

remains exact as long as  $x$  is both  $M$ -regular and  $R$ -regular (that is a nonzero divisor of both  $M$  and  $R$ ). Moreover, it is a minimal free  $M/xM$  resolution over  $R/x$  since

$$\bar{\varphi}_i(F_i/xF_i) \subset \bar{\mathfrak{m}}(F_i/xF_i)$$

for all  $0 \leq i \leq n$ , where  $\bar{\mathfrak{m}}$  is the maximal ideal in  $R/x$ . It follows from the induction hypothesis, that

$$\begin{aligned} \text{pd}_R M + \text{depth}_R M &= \text{pd}_{R/x}(M/xM) + \text{depth}_{R/x}(M/xM) + 1 \\ &= \text{depth}_{R/x}(R/x) + 1 \\ &= \text{depth}_R R. \end{aligned}$$

Finally, assume  $\text{depth } R > 0$  and  $\text{depth } M = 0$ . Then  $\text{pd}_R M > 0$ , because otherwise  $M$  would be free and we would have  $\text{depth } M = \text{depth } R > 0$ , which is a contradiction. Let

$$0 \longrightarrow N \longrightarrow F \longrightarrow M \longrightarrow 0$$

be an exact sequence where  $F$  is a finitely generated free  $R$ -module and  $0 \neq N \subset \mathfrak{m}F$ . We apply Lemma (14.5) and obtain  $\text{depth } N = 1$ . Therefore by the previous case, we have

$$\begin{aligned} \text{depth } M + \text{pd}_R M &= \text{depth } N - 1 + \text{pd}_R N + 1 \\ &= \text{depth } N + \text{pd}_R N \\ &= \text{depth } R. \end{aligned}$$

□

**Example 14.1.** Let  $A = K[x, y, z]_{\langle x, y, z \rangle}$  and let  $I$  be an ideal in  $A$  given by  $I = \langle xz, yz \rangle$ . We want to compute a minimal free resolution of  $A/I$ . Then we would have  $\text{depth}(A/I) = n - \text{pd}_A(A/I)$ .

$$0 \longrightarrow A \xrightarrow{\begin{pmatrix} -y \\ x \end{pmatrix}} A^2 \xrightarrow{\begin{pmatrix} xz & yz \end{pmatrix}} A \longrightarrow A/I$$

So  $\text{pd}_A(A/I) = 2$ , hence  $\text{depth}(A/I) = 1$ . On the other hand, we know that  $\dim(A/I) \geq 2$ , since

$$A \supset \langle x, y, z \rangle \supset \langle y, z \rangle \supset \langle z \rangle \supset I$$

gives a chain of prime ideals of length 2. Therefore  $A/I$  is not a Cohen Macaulay  $A$ -module.

**Example 14.2.** Let  $A = K[x, y, z]_{\langle x, y, z \rangle}$  and let  $I$  be an ideal in  $A$  given by  $I = \langle xy, xz, yz \rangle$ . A minimal free resolution of  $A/I$  is given by

$$0 \longrightarrow A^2 \xrightarrow{\begin{pmatrix} 0 & -z \\ -y & y \\ x & 0 \end{pmatrix}} A^3 \xrightarrow{\begin{pmatrix} xy & xz & yz \end{pmatrix}} A \longrightarrow A/I$$

So  $\text{pd}_A(A/I) = 2$ , hence  $\text{depth}(A/I) = 1$ . We also have  $\dim(A/I) = 1$ , so  $A/I$  is a Cohen Macaulay  $A$ -module.

## 15 Category Theory

ZFC stands for Zermelo-Frankel + Axiom of Choice. There are  $9 + 1$  axioms in ZFC. We also consider NGB (Von Neumann-Gödel-Bernays).

## 15.1 Definition of a Category

**Definition 15.1.** A **category**  $\mathcal{C}$  consists of:

- A class  $\text{Ob}(\mathcal{C})$  of **objects**. If  $x \in \text{Ob}(\mathcal{C})$ , we simply write  $x \in \mathcal{C}$ .
- Given  $x, y \in \mathcal{C}$ , there's a class  $\text{Mor}_{\mathcal{C}}(x, y)$  of **morphisms**, whose elements are called **morphisms** or **arrows** from  $x$  to  $y$ . If  $f \in \text{Mor}_{\mathcal{C}}(x, y)$ , we write  $f: x \rightarrow y$ .
- Given  $f: x \rightarrow y$  and  $g: y \rightarrow z$ , there is a morphism called their **composite** and is denoted  $g \circ f: x \rightarrow z$ . To clean notation, we sometimes denote the composite as  $gf$ .

- Composition is associative:  $(h \circ g) \circ f = h \circ (g \circ f)$  if either side is well-defined.

- For any  $x \in \mathcal{C}$ , there is an **identity morphism**  $1_x: x \rightarrow x$

- We have the **left and right unity laws**:

$$1_x \circ f = f \text{ for any } f: y \rightarrow x$$

$$g \circ 1_x = g \text{ for any } g: x \rightarrow y$$

### 15.1.1 Functors exactness

**Proposition 15.1.** Let  $\mathcal{F}$  and  $\mathcal{G}$  be two functors from the category of  $R$ -modules to itself, let  $\tau: \mathcal{F} \rightarrow \mathcal{G}$  be a natural isomorphism, and let

$$M_1 \xrightarrow{\varphi_1} M_2 \xrightarrow{\varphi_2} M_3$$

be exact at  $M_2$ . Then

$$\mathcal{F}(M_1) \xrightarrow{\mathcal{F}(\varphi_1)} \mathcal{F}(M_2) \xrightarrow{\mathcal{F}(\varphi_2)} \mathcal{F}(M_3) \quad (64)$$

is exact at  $\mathcal{F}(M_2)$  if and only if

$$\mathcal{G}(M_1) \xrightarrow{\mathcal{G}(\varphi_1)} \mathcal{G}(M_2) \xrightarrow{\mathcal{G}(\varphi_2)} \mathcal{G}(M_3)$$

is exact at  $\mathcal{G}(M_2)$ .

*Proof.* The natural transformation  $\tau: \mathcal{F} \rightarrow \mathcal{G}$  gives us the commutative diagram

$$\begin{array}{ccccc} \mathcal{F}(M_1) & \xrightarrow{\mathcal{F}(\varphi_1)} & \mathcal{F}(M_2) & \xrightarrow{\mathcal{F}(\varphi_2)} & \mathcal{F}(M_3) \\ \downarrow \tau_{M_1} & & \downarrow \tau_{M_2} & & \downarrow \tau_{M_3} \\ \mathcal{G}(M_1) & \xrightarrow{\mathcal{G}(\varphi_1)} & \mathcal{G}(M_2) & \xrightarrow{\mathcal{G}(\varphi_2)} & \mathcal{G}(M_3) \end{array}$$

The proposition follows trivially from the  $3 \times 3$  lemma. □

## 15.2 Colimits

**Definition 15.2.** Let  $X$  be a set. A **preorder** on  $X$  is a binary relation that is reflexive and transitive.

**Definition 15.3.** Let  $(I, \leq)$  be a preordered set. A system  $(M_i, \mu_{ij})$  of  $R$ -modules over  $I$  consists of a family of  $R$ -modules  $\{M_i\}_{i \in I}$  indexed by  $I$  and a family of  $R$ -module maps  $\{\mu_{ij}: M_i \rightarrow M_j\}_{i \leq j}$  such that for all  $i \leq j \leq k$ ,

$$\mu_{ii} = 1_{M_i} \quad \text{and} \quad \mu_{ik} = \mu_{jk}\mu_{ij}.$$

We say  $(M, \mu_{ij})$  is a **directed system** if  $I$  is a directed set.

**Lemma 15.1.** Let  $(M_i, \mu_{ij})$  be a system of  $R$ -modules over the preordered set  $I$ . The colimit of the system  $(M_i, \mu_{ij})$  is the quotient  $R$ -modules

$$\bigoplus_{i \in I} M_i / \langle \{(\iota_i(u_i) - \iota_j(\mu_{ij}(u_i))) \mid u_i \in M_i \text{ and } i \in I\} \rangle,$$

where  $\iota_i: M_i \rightarrow \bigoplus_{i \in I} M_i$  is the natural inclusion. We denote the colimit  $M = \text{colim}_i M_i$ . We denote  $\pi: \bigoplus_{i \in I} M_i \rightarrow M$  the projection map and  $\phi_i = \pi \circ \iota_i: M_i \rightarrow M$ .

*Proof.* Note that  $\phi_i = \phi_j \circ \mu_{ij}$  in the above construction. Indeed, let  $u_i \in M_i$ . Then

$$\begin{aligned} (\phi_j \mu_{ij})(u_i) &= (\pi \iota_j \mu_{ij})(u_i) \\ &= \pi(\iota_j(\mu_{ij}(u_i))) \\ &= \pi(\iota_i(u_i)) \\ &= (\pi \iota_i)(u_i) \\ &= \phi_i(u_i). \end{aligned}$$

To show the pair  $(M, \phi_i)$  is the colimit we have to show it satisfies the universal property: for any other such pair  $(Y, \psi_i)$  with  $\psi_i: M_i \rightarrow Y$  and  $\psi_i = \psi_j \circ \mu_{ij}$ , there is a unique  $R$ -module homomorphism  $g: M \rightarrow Y$  such that the following diagram commutes:

$$\begin{array}{ccc} M_i & \xrightarrow{\mu_{ij}} & M_j \\ \phi_i \searrow & & \swarrow \phi_j \\ & M & \\ \psi_i \searrow & \downarrow g & \swarrow \psi_j \\ & Y & \end{array}$$

and this is clear because we can define  $g$  by taking the map  $\psi_i$  on the summand  $M_i$  in the direct sum  $\bigoplus M_i$ .  $\square$

**Lemma 15.2.** Let  $(M_i, \mu_{ij})$  be a system of  $R$ -modules over the preordered set  $I$ . Assume that  $I$  is directed. The colimit of the system  $(M_i, \mu_{ij})$  is canonically isomorphic to the module  $M$  defined as follows:

1. as a set let

$$M = \left( \coprod_{i \in I} M_i \right) / \sim$$

where for  $u \in M_i$  and  $u' \in M_{i'}$  we have

$$u \sim u' \text{ if and only if } \mu_{ij}(u) = \mu_{i'j}(u') \text{ for some } j \geq i, i'$$

2. as an abelian group for  $u \in M_i$  and  $u' \in M_{i'}$  we define the sum of the classes of  $u$  and  $u'$  in  $M$  to be the class of  $\mu_{ij}(u) + \mu_{i'j}(u')$  where  $j \in I$  is any index with  $i \leq j$  and  $i' \leq j$ , and
3. as an  $R$ -module define  $u \in M_i$  and  $a \in R$  the product of  $a$  and the class of  $u$  in  $M$  to be the class of  $au$  in  $M$ .

The canonical maps  $\phi_i: M_i \rightarrow M$  are induced by the canonical maps  $M_i \rightarrow \coprod_{i \in I} M_i$ .

## 15.3 Adjoint Functors
